AN

ESSAY

ON THE

PRINCIPLE OF POPULATION,

AS IT AFFECTS

THE FUTURE IMPROVEMENT OF SOCIETY.

WITH REMARKS

ON THE SPECULATIONS OF MR. GODWIN,

M. CONDORCET,

AND OTHER WRITERS.

LONDON:

PRINTED FOR J. JOHNSON, IN ST. PAUL'S CHURCH-YARD.

1798.

PREFACE.

THE following Effay owes its origin to a conversation with a friend, on the fubject of Mr. Godwin's Essay, on avarice and profusion, in his Enquirer. The discussion, started the general question of the future improvement of fociety; and the Author at first fat down with an intention of merely stating his thoughts to his friend, upon paper, in a clearer manner than he thought he could do, in conversation. But as the subject opened upon him, fome ideas occurred, which he did not recollect to have met with before; and as he conceived, that every, the least light, on a topic so generally interesting, might be received with candour, he determined to put his thoughts in a form for publication.

A

The

The essay might, undoubtedly, have been rendered much more complete by a collection of a greater number of facts in elucidation of the general argument. But a long and almost total interruption, from very particular business, joined to a defire (perhaps imprudent) of not delaying the publication much beyond the time that he originally proposed, prevented the Author from giving to the fubject an undivided attention. He prefumes, however, that the facts which he has adduced, will be found, to form no inconsiderable evidence for the truth of his opinion respecting the future improvement of mankind. As the Author contemplates this opinion at prefent, little more appears to him to be necesfary than a plain statement, in addition to the most cursory view of society, to establish it.

It is an obvious truth, which has been taken notice of by many writers, that population must always be kept down to the level of the means of subfistence; but no writer, that the Author recollects, has inquired particularly into the means by which this level is effected: and it is a view of these means, which forms, to his mind, the strongest obstacle in the way to any very great future improvement of fociety. He hopes it will appear, that, in the discussion of this interesting subject; he is actuated folely by a love of truth; and not by any prejudices against any particular set of men, or of opinions. He professes to have read some of the speculations on the future improvement of fociety, in a temper very different from a wish to find them visionary; but he has not acquired that command over his understanding which would enable him to believe what he wishes, without evidence, or to refuse his affent to what might be unpleasing, when accompanied with evidence.

The view which he has given of human life has a melancholy hue; but he feels confcious, that he has drawn these dark tints, from a conviction that they are really in the picture; and not from a jaundiced eye, or an inherent spleen of disposition. The theory of mind which he has sketched in the two last chapters, accounts to his own understanding, in a satisfactory manner, for the existence of most of the evils of life; but whether it will have the same effect upon others, must be left to the judgment of his readers.

If he should succeed in drawing the attention of more able men, to what he conceives to be the principal difficulty in the

the way to the improvement of fociety, and should, in consequence, see this difficulty removed, even in theory, he will gladly retract his present opinions, and rejoice in a conviction of his error.

June 7, 1798.

CONTENTS.

CHAP. I.

Question stated.—Little prospect of a determination of it, from the enmity of the opposing parties.—The principal argument against the perfectibility of man and of society has never been fairly answered.—Nature of the difficulty arising from population.—Outline of the principal argument of the essay.

CHAP. II.

The different ratios in which population and food increase.—The necessary effects of these different ratios of increase.—Oscillation produced by them in the condition of the lower classes of society.—Reasons why this oscillation has not been so much observed as might be expected.—Three propositions on which the general argument of the essay depends.—The different states in which mankind have been known to exist proposed to be examined with reference to these three propositions.

p. 18.

CHAP. III.

The savage or hunter state shortly reviewed.—The shepherd state, or the tribes of barbarians that overran the Roman Empire.—The superiority of the power of population to the means of subsistence, the cause of the great tide of Northern Emigration. p. 39.

CHAP. IV.

State of civilized nations.—Probability that Europe is much more populous now than in the time of Julius Cæsar.—Best criterion of population.—Probable error of Hume in one of the criterions that he proposes as assisting in an estimate of population.—Slow increase of population at present inmost of the states of Europe.—The two principal checks to population.—The sirst, or preventive check, examined with regard to England. p. 53.

CHAP. V.

The second, or positive check to population examined, in England.—The true cause why the immense sum collected in England for the poor does not better their condition.

dition.—The powerful tendency of the poor laws to defeat their own purpose.—Palliative of the distresses of the poor proposed.—The absolute impossibility from the fixed laws of our nature, that the pressure of want can ever be completely removed from the lower classes of society.—All the checks to population may be resolved into misery or vice.

p. 71.

CHAP. VI.

New colonies.—Reasons of their rapid increase.—North
American Colonies.—Extraordinary instance of increase
in the back settlements.—Rapidity with which even old
states recover the ravages of war, pestilence, famine, or
the convulsions of nature.

p. 101.

CHAP. VII.

A probable cause of epidemics.—Extracts from Mr. Sufmilch's tables.—Periodical returns of sickly seasons to be expected in certain cases.—Proportion of births to burials for short periods in any country an inadequate criterion of the real average increase of population.—Best criterion of a permanent increase of population.—Great frugality of living one of the causes of the the famines of China and Indostan.—Evil tendency of one of the clauses in Mr. Pitt's Poor Bill.—Only one proper way of encouraging population.—Causes of the happiness of nations.—Famine, the last and most dreadful mode by which nature represses a redundant population.—The three propositions considered as established.

p. 113.

CHAP. VIII.

Mr. Wallace.—Error of supposing that the difficulty arising from population is at a great distance.—Mr. Condorcet's sketch of the progress of the human mind.—Period when the oscillation, mentioned by Mr. Condorcet, ought to be applied to the human race. p. 142.

CHAP. IX.

Mr. Condorcet's conjecture concerning the organic perfectibility of man, and the indefinite prolongation of human life.—Fallacy of the argument, which infers an unlimited progress from a partial improvement, the limit of which cannot be ascertained, illustrated in the breeding of animals, and the cultivation of plants.

p. 155.

CHAP,

CHAP. X.

Mr. Godwin's system of equality.—Error of attributing all the vices of mankind to human institutions.—Mr. Godwin's sirst answer to the difficulty arising from population totally insufficient.—Mr. Godwin's beautiful system of equality supposed to be realized.—It's utter destruction simply from the principle of population in so short a time as thirty years.

p. 173.

CHAP. XI.

Mr. Godwin's conjecture concerning the future extinction of the passion between the sexes.—Little apparent grounds for such a conjecture.—Passion of love not inconsistent either with reason or virtue.

p. 210.

CHAP. XII.

Mr. Godwin's conjecture concerning the indefinite prolongation of human life.—Improper inference drawn from the effects of mental stimulants on the human frame, illustrated in various instances.—Conjectures not founded on any indications in the past, not to be considered as philosophical conjectures.—Mr. Godwin's and Mr.

Condorcet's conjecture respecting the approach of man towards immortality on earth, a curious instance of the inconsistency of scepticism.

p. 219.

CHAP. XIII.

Error of Mr. Godwin in considering man too much in the light of a being merely rational.—In the compound being, man, the passions will always act as disturbing forces in the decisions of the understanding.—Reasonings of Mr. Godwin on the subject of coercion.—Some truths of a nature not to be communicated from one man to another.

p. 250.

CHAP. XIV.

Mr. Godwin's five propositions respecting political truth, on which his whole work hinges, not established.—Reasons we have for supposing, from the distress occasioned by the principle of population, that the vices, and moral weakness of man can never be wholly eradicated.

—Perfectibility, in the sense in which Mr. Godwin uses the term, not applicable to man.—Nature of the real persectibility of man illustrated.

p. 264:

CHAP. XV.

Models too perfect, may sometimes rather impede than promote improvement.—Mr. Godwin's essay on avarice and profusion.—Impossibility of dividing the necessary labour of a society amicably among all.—Invectives against labour may produce present evil, with little or no chance of producing future good.—An accession to the mass of agricultural labour must always be an advantage to the labourer.

p. 279.

CHAP. XVI.

Probable error of Dr. Adam Smith in representing every increase of the revenue or stock of a society as an increase in the funds for the maintenance of labour.—Instances where an increase of wealth can have no tendency to better the condition of the labouring poor.—England has increased in riches without a proportional increase in the funds for the maintenance of labour.—The state of the poor in China would not be improved by an increase of wealth from manufastures.

p. 303.

CHAP. XVII.

Question of the proper definition of the wealth of a state.

—Reason given by the French Economists for considering all manufacturers as unproductive labourers, not the true reason.—The labour of artificers and manufacturers sufficiently productive to individuals, though not to the state.—A remarkable passage in Dr. Price's two volumes of observations.—Error of Dr. Price in attributing the happiness and rapid population of America, chiefly, to its peculiar state of civilization.—No advantage can be expected from shutting our eyes to the difficulties in the way to the improvement of society. p.327.

CHAP. XVIII.

The constant pressure of distress on man, from the principle of population, seems to direct our hopes to the future.

—State of trial inconsistent with our ideas of the fore-knowledge of God.—The world, probably, a mighty process for awakening matter into mind.—Theory of the formation of mind.—Excitements from the wants of the body.—Excitements from the operation of general laws.

—Excitements from the difficulties of life arising from the principle of population.

p. 348.

CHAP.

CHAP. XIX.

The forrows of life necessary to soften and humanize the beart.—The excitements of social sympathy often produce characters of a higher order than the mere possessor of talents.—Moral evil probably necessary to the production of moral excellence.—Excitements from intellectual wants continually kept up by the infinite variety of nature, and the obscurity that involves metaphysical subjects.—The difficulties in Revelation to be accounted for upon this principle.—The degree of evidence which the scriptures contain, probably, best suited to the improvement of the human faculties, and the moral amelioration of mankind.—The idea that mind is created by excitements, seems to account for the existence of natural and moral evil.

ESSA,Y

ON THE

PRINCIPLE OF POPULATION.

CHAPTER I.

Question stated.—Little prospect of a determination of it, from the enmity of the opposing parties.—The principal argument against the perfectibility of man and of society has never been fairly answered.—Nature of the difficulty arising from population.—Outline of the principal argument of the essay.

THE great and unlooked for discoveries that have taken place of late years in natural philosophy; the increasing disfusion of general knowledge from the extension of the art of printing; the ardent and unshackled spirit of inquiry that prevails throughout the lettered, and even unlettered world; the new and extraordinary

lights

lights that have been thrown on political fubjects, which dazzle, and aftonish the understanding; and particularly that tremendous phenomenon in the political horizon the French revolution, which, like a blazing comet, seems destined either to inspire with fresh life and vigour, or to scorch up and destroy the shrinking inhabitants of the earth, have all concurred to lead many able men into the opinion, that we were touching on a period big with the most important changes, changes that would in some measure be decisive of the future sate of mankind.

It has been faid, that the great question is now at issue, whether man shall henceforth start forwards with accelerated velocity towards illimitable, and hitherto
unconceived improvement; or be condemned to a perpetual oscillation between
happiness and misery, and after every
effort

effort remain still at an immeasurable distance from the wished-for goal.

Yet, anxiously as every friend of mankind must look forwards to the termination of this painful suspense; and, eagerly as the inquiring mind would hail every ray of light that might assist its view into suturity, it is much to be lamented, that the writers on each side of this momentous question still keep sar aloof from each other. Their mutual arguments do not meet with a candid examination. The question is not brought to rest on sewer points; and even in theory scarcely seems to be approaching to a decision.

The advocate for the prefent order of things, is apt to treat the fect of speculative philosphers, either as a set of artful and designing knaves, who preach up ardent benevolence, and draw capti-

B 2

-vating

vating pictures of a happier state of society, only the better to enable them to destroy the present establishments, and to forward their own deep-laid schemes of ambition: or, as wild and mad-headed enthusiasts, whose silly speculations, and absurd paradoxes, are not worthy the attention of any reasonable man.

The advocate for the perfectibility of man, and of fociety, retorts on the defender of establishments a more than equal contempt. He brands him as the slave of the most miserable, and narrow prejudices; or, as the defender of the abuses of civil fociety, only because he profits by them. He paints him either as a character who profitutes his understanding to his interest; or as one whose powers of mind are not of a fize to grasp any thing great and noble; who cannot see above five yards before him; and who

must therefore be utterly unable to take in the views of the enlightened benefactor of mankind.

In this unamicable contest, the cause of truth cannot but suffer. The really good arguments on each side of the question are not allowed to have their proper weight. Each pursues his own theory, little solicitous to correct, or improve it, by an attention to what is advanced by his opponents.

The friend of the present order of things condemns all political speculations in the gross. He will not even condescend to examine the grounds from which the perfectibility of society is inferred. Much less will be give himself the trouble in a fair and candid manner to attempt an exposition of their fallacy.

The speculative philosopher equally offends against the cause of truth. With eyes fixed on a happier state of society, the blessings of which he paints in the most captivating colours, he allows himself to indulge in the most bitter invectives against every present establishment, without applying his talents to consider the best and safest means of removing abuses, and without seeming to be aware of the tremendous obstacles that threaten, even in theory, to oppose the progress of man towards persection.

It is an acknowledged truth in philofophy, that a just theory will always be confirmed by experiment. Yet so much friction, and so many minute circumstances occur in practice, which it is next to impossible for the most enlarged and penetrating mind to foresee, that on sew subjects can any theory be pronounced just, just, that has not stood the test of experience. But an untried theory cannot fairly be advanced as probable, much less as just, till all the arguments against it, have been maturely weighed, and clearly and consistently resuted.

I have read fome of the speculations on the perfectibility of man and of fociety, with great pleafure. I have been warmed and delighted with the enchanting picture which they hold forth. I ardently wish for such happy improvements. But I fee great, and, to my understanding, unconquerable difficulties in the way to them. These difficulties it is my present purpose to state; declaring, at the same time, that fo far from exulting in them, as a cause of triumph over the friends of innovation, nothing would give me greater pleafure than to fee them completely removed.

The most important argument that I shall adduce is certainly not new. The principles on which it depends have been explained in part by Hume, and more at large by Dr. Adam Smith. It has been advanced and applied to the prefent fubject, though not with its proper weight, or in the most forcible point of view, by Mr. Wallace: and it may probably have been stated by many writers that I have never met with. I should certainly therefore not think of advancing it again, though I mean to place it in a point of view in fome degree different from any that I have hitherto feen, if it had ever been fairly and fatisfactorily answered.

The cause of this neglect on the part of the advocates for the persectibility of mankind, is not easily accounted for. I cannot doubt the talents of such men as Godwin and Condorcet. I am unwilling to doubt their candour. To my understanding, and probably to that of most others, the difficulty appears infurmountable. Yet these men of acknowledged ability and penetration, fcarcely deign to notice it, and hold on their course in such speculations, with unabated ardour, and undiminished confidence. I have certainly no right to fay that they purposely shut their eyes to such arguments. I ought rather to doubt the validity of them, when neglected by fuch men, however forcibly their truth may strike my own mind. Yet in this respect it must be acknowledged that we are all of us too prone to err. If I saw a glass of wine repeatedly prefented to a man, and he took no notice of it, I should be apt to think that he was blind or uncivil. A juster philosophy might teach me rather to think that my eyes deceived me, and that the offer was not really what I conceived it to be.

In entering upon the argument I must premise that I put out of the question, at prefent, all mere conjectures; that is, all fuppositions, the probable realization of which cannot be inferred upon any just philosophical grounds. A writer may tell me that he thinks man will ultimately become an oftrich. I cannot properly contradict him. But before he can expect to bring any reasonable person over to his opinion, he ought to flew, that the necks of mankind have been gradually elongating; that the lips have grown harder, and more prominent; that the legs and feet are daily altering their shape; and that the hair is beginning to change into stubs of feathers. And till the probability of fo wonderful a conversion can be shewn, it is furely loft time and loft eloquence to expatiate on the happiness of man in fuch a state; to describe his powers, both of running and flying; to paint him in

a condition where all narrow luxuries would be contemned; where he would be employed only in collecting the necessaries of life; and where, consequently, each man's share of labour would be light, and his portion of leifure ample.

I think I may fairly make two postulata.

First, That food is necessary to the existence of man.

Secondly, That the passion between the sexes is necessary, and will remain nearly in its present state.

These two laws ever since we have had any knowledge of mankind, appear to have been fixed laws of our nature; and, as we have not hitherto seen any alteration in them, we have no right to conclude that they will ever cease to be what they now are, without an immediate act of power in that Being who first arranged the system of the universe; and for the advantage of his creatures, still executes, according to fixed laws, all its various operations.

I do not know that any writer has fupposed that on this earth man will ultimately be able to live without food. But Mr. Godwin has conjectured that the passion between the sexes may in time be extinguished. As, however, he calls this part of his work, a deviation into the land of conjecture, I will not dwell longer upon it at present, than to say, that the best arguments for the perfectibility of man, are drawn from a contemplation of the great progress that he has already made from the savage state, and the difficulty of saying where

he is to stop. But towards the extinction of the passion between the sexes, no progrefs whatever has hitherto been made. It appears to exist in as much force at present as it did two thousand, or four thousand years ago. There are individual exceptions now as there always have been. But, as thefe exceptions do not appear to increase in number, it would furely be a very unphilosophical mode of arguing, to infer merely from the existence of an exception, that the exception would, in time, become the rule, and the rule the exception.

Assuming then, my postulata as granted, I say, that the power of population is indefinitely greater than the power in the earth to produce subsistence for man.

Population, when unchecked, increases in a geometrical ratio. Subfishence increases only in an arithmetical ratio. A slight acquaintance with numbers will shew the immensity of the first power in comparison of the second.

By that law of our nature which makes food necessary to the life of man, the effects of these two unequal powers must be kept equal.

This implies a firong and conftantly operating check on population from the difficulty of fubfiftence. This difficulty must fall some where; and must necessarily be severely felt by a large portion of mankind.

Through the animal and vegetable kingdoms, nature has feattered the feeds

of life abroad with the most profuse and liberal hand. She has been comparatively sparing in the room, and the nourishment necessary to rear them. The germs of existence contained in this fpot of earth, with ample food, and ample room to expand in, would fill millions of worlds in the course of a few thousand years. Necessity, that imperious all pervading law of nature, reftrains them within the prescribed bounds. The race of plants, and the race of animals shrink under this great restrictive law. And the race of man cannot, by any efforts of reason, escape from it. Among plants and animals its effects are waste of feed, sickness, and premature death. Among mankind, mifery and vice. The former, mifery, is an absolutely necessary consequence of it. Vice is a highly probable confequence, and we therefore fee it abundantly prevail; but it ought not, perhaps, to be called an absolutely necesfary consequence. The ordeal of virtue is to resist all temptation to evil.

This natural inequality of the two powers of population, and of production in the earth, and that great law of our nature which must constantly keep their effects equal, form the great difficulty that to me appears infurmountable in the way to the perfectibility of fociety. All other arguments are of flight and fubordinate confideration in comparison of this. I fee no way by which man can efcape from the weight of this law which pervades all animated nature. No fancied equality, no agrarian regulations in their utmost extent, could remove the pressure of it even for a single century. And it appears, therefore, to be decifive against the possible existence of a fociety,

a fociety, all the members of which, should live in ease, happiness, and comparative leisure; and feel no anxiety about providing the means of subsistence for themselves and families.

Consequently, if the premises are just, the argument is conclusive against the perfectibility of the mass of mankind.

I have thus sketched the general outline of the argument; but I will examine it more particularly; and I think it will be found that experience, the true source and foundation of all knowledge, invariably confirms its truth.

CHAP. II.

The different ratios in which population and food increase.—The necessary effects of these different ratios of increase.—Oscillation produced by them in the condition of the lower classes of society.—Reasons why this oscillation has not been so much observed as might be expected.—Three propositions on which the general argument of the essay depends.—The different states in which manking have been known to exist proposed to be examined with reference to these three propositions.

I said that population, when unchecked, increased in a geometrical ratio; and subsistence for man in an arithmetical ratio.

Let us examine whether this position be just.

I think it will be allowed, that no state has hitherto existed (at least that we have any account of) where the manners were fo pure and simple, and the means of subsistence so abundant; that no check whatever has existed to early marriages; among the lower classes; from a fear of not providing well for their families; or among the higher classes, from a fear of lowering their condition in life. Consequently in no state that we have yet known, has the power of population been left to exert itself with perfect freedom.

Whether the law of marriage be inflituted, or not, the dictate of nature and virtue, feems to be an early attachment to one woman. Supposing a liberty of changing in the case of an unfortunate choice, this liberty would not affect population till it arose to a height greatly vicious; and we are now supposing the existence of a society where vice is scarcely known. In a ftate therefore of great equality and virtue, where pure and fimple manners prevailed, and where the means of fubfiftence were fo abundant, that no part of the fociety could have any fears about providing amply for a family, the power of population being left to exert itfelf unchecked, the increase of the human species would evidently be much greater than any increase that has been hitherto known.

In the United States of America, where the means of fublistence have been more ample, the manners of the people more pure, and confequently the checks to early marriages fewer, than in any of the modern states of Europe, the population has been found to double itself in twenty-five years.

This ratio of increase, though short of the utmost power of population, yet

as the refult of actual experience, we will take as our rule; and fay,

That population, when unchecked, goes on doubling itself every twenty-five years, or increases in a geometrical ratio.

Let us now take any fpot of earth, this Island for instance, and see in what ratio the subsistence it affords can be supposed to increase. We will begin with it under its present state of cultivation.

If I allow that by the best possible policy, by breaking up more land, and by great encouragements to agriculture, the produce of this Island may be doubled in the first twenty-five years, I think it will be allowing as much as any person can well demand.

In the next twenty-five years, it is impossible to suppose that the produce could be quadrupled. It would be contrary to all our knowledge of the qualities of land. The very utmost that we can conceive, is, that the increase in the fecond twenty-five years might equal the present produce. Let us then take this for our rule, though certainly far beyond the truth; and allow that by great exertion, the whole produce of the Island might be increased every twentyfive years, by a quantity of fublistence equal to what it at prefent produces. The most enthusiastic speculator cannot suppose a greater increase than this, In a few centuries it would make every acre of land in the Island like a garden.

Yet this ratio of increase is evidently arithmetical.

It may be fairly faid, therefore, that the means of fublistence increase in an arithmetical ratio.

Let us now bring the effects of these two ratios together.

The population of the Island is computed to be about feven millions; and we will suppose the present produce equal to the support of such a number. In the first twenty-five years the population would be fourteen millions; and the food being also doubled, the means of fubfistence would be equal to this increase. In the next twenty-five years the population would be twenty-eight millions; and the means of subfistence only equal to the support of twenty-one millions. In the next period, the population would be fifty-fix millions, and the means of subfiftence just sufficient for half that number. And at the conclufion of the first century, the population would be one hundred and twelve millions, and the means of subsistence only equal to the support of thirty-sive millions; which would leave a population of seventy-seven millions totally upprovided for.

A great emigration necessarily implies unhappiness of some kind or other in the country that is deserted. For sew persons will leave their families, connections, friends, and native land, to seek a settlement in untried foreign climes, without some strong subsisting causes of uneasiness where they are, or the hope of some great advantages in the place to which they are going.

But to make the argument more general, and less interrupted by the partial

tial views of emigration, let us take the whole earth, instead of one spot, and suppose that the restraints to population were universally removed. If the substitute fistence for man that the earth affords was to be increased every twenty-sive years by a quantity equal to what the whole world at present produces; this would allow the power of production in the earth to be absolutely unlimited, and its ratio of increase much greater than we can conceive that any possible exertions of mankind could make it.

Taking the population of the world at any number, a thousand millions, for instance, the human species would increase in the ratio of—1, 2, 4, 8,/16, 32, 64, 128,/256, 512, &c. and subsistence as—1, 2, 3, 4,/5, 6, 7, 8,/9, 10, &c. In two centuries and a quarter, the population would be to the means of

fublistence as 512 to 10: in three centuries as 4096 to 13; and in two thoufand years the difference would be almost incalculable, though the produce in that time would have increased to an immense extent.

No limits whatever are placed to the productions of the earth; they may increase for ever and be greater than any assignable quantity; yet still the power of population being a power of a superior order, the increase of the human species can only be kept commensurate to the increase of the means of subsistence, by the constant operation of the strong law of necessity acting as a check upon the greater power.

The effects of this check remain now to be confidered.

Among plants and animals the view of the subject is simple. They are all impelled by a powerful instinct to the increase of their species; and this instinct is interrupted by no reasoning, or doubts about providing for their offspring. Wherever therefore there is liberty, the power of increase is exerted; and the superabundant effects are repressed afterwards by want of room and nourishment, which is common to animals and plants; and among animals, by becoming the prey of others.

The effects of this check on man are more complicated.

Impelled to the increase of his species by an equally powerful instinct, reason interrupts his career, and asks him whether he may not bring beings into the world, for whom he cannot provide

the means of subfiftence. In a state of equality, this would be the simple queftion. In the prefent state of fociety, other confiderations occur. Will he not lower his rank in life? Will he not fubject himself to greater difficulties than he at prefent feels? Will he not be obliged to labour harder? and if he has a large family, will his utmost exertions enable him to support them? May he not fee his offspring in rags and mifery, and clamouring for bread that he cannot give them? And may he not be reduced to the grating necessity of forfeiting his independence, and of being obliged to the fparing hand of charity for support?

These considerations are calculated to prevent, and certainly do prevent, a very great number in all civilized nations from pursuing the dictate of nature in an early attachment to one woman. And this restraint

restraint almost necessarily, though not absolutely so, produces vice. Yet in all societies, even those that are most vicious, the tendency to a virtuous attachment is so strong, that there is a constant effort towards an increase of population. This constant effort as constantly tends to subject the lower classes of the society to distress, and to prevent any great permanent amelioration of their condition.

The way in which these effects are produced seems to be this.

We will suppose the means of subsistence in any country just equal to the easy support of its inhabitants. The constant effort towards population, which is found to act even in the most vicious societies, increases the number of people before the means of subsistence are increased. The food therefore which before supported feven millions, must now be divided among feven millions and a half or eight millions. The poor confequently must live much worfe, and many of them be reduced to fevere diffress. The number of labourers also being above the proportion of the work in the market, the price of labour must tend . toward a decrease; while the price of provisions would at the same time tend to rife. The labourer therefore must work harder to earn the fame as he did before. During this feafon of diffress, the discouragements to marriage, and the difficulty of rearing a family are fo great, that population is at a stand. In the mean time the cheapness of labour, the plenty of labourers, and the necessity of an increafed industry amongst them, encourage cultivators to employ more labour upon their land; to turn up fresh soil, and to manure

man

manure and improve more completely what is already in tillage; till ultimately the means of fubfiftence become in the fame proportion to the population as at the period from which we fet out. The fituation of the labourer being then again tolerably comfortable, the reftraints to population are in fome degree loofened; and the fame retrograde and progressive movements with respect to happiness are repeated.

This fort of oscillation will not be remarked by superficial observers; and it may be difficult even for the most penetrating mind to calculate its periods. Yet that in all old states some such vibration does exist; though from various transverse causes, in a much less marked, and in a much more irregular manner than I have described it, no restecting

man who confiders the fubject deeply can well doubt.

Many reasons occur why this oscillation has been less obvious, and less decidedly confirmed by experience, than might naturally be expected.

One principal reason is, that the histories of mankind that we possess, are histories only of the higher classes. We have but sew accounts that can be depended upon of the manners and customs of that part of mankind, where these retrograde and progressive movements chiefly take place. A satisfactory history of this kind, of one people, and of one period, would require the constant and minute attention of an observing mind during a long life. Some of the objects of enquiry would be, in what proportion to the number of adults was

the number of marriages: to what extent vicious customs prevailed in consequence of the restraints upon matrimony: who is was the comparative mortality among the children of the most distressed part of the community, and those who lived rather more at their ease: what were the variations in the real price of labour: and what were the observable differences in the state of the lower classes of society, with respect to ease and happiness, at different times during a certain period.

Such a history would tend greatly to elucidate the manner in which the conflant check upon population acts; and would probably prove the existence of the retrograde and progressive movements that have been mentioned; though the times of their vibration must necesfarily be rendered irregular, from the

operation of many interrupting causes; such as, the introduction or failure of certain manufactures: a greater or less prevalent spirit of agricultural enterprize: years of plenty, or years of scarcity: wars and pestilence: poor laws: the invention of processes for shortening labour without the proportional extension of the market for the commodity: and, particularly, the difference between the nominal and real price of sabour; a circumstance, which has perhaps more than any other, contributed to conceal this oscillation from common view.

It very rarely happens that the nominal price of labour univerfally falls; but we well know that it frequently remains the fame, while the nominal price of provisions has been gradually increasing. This is, in effect, a real fall in the price of labour; and during this period,

period, the condition of the lower orders of the community must gradually grow worfe and worfe. But the farmers and capitalists are growing rich from the real cheapness of labour. Their increased capitals enable them to employ a greater number of men. Work therefore may be plentiful; and the price of labour would confequently rife. But the want of freedom in the market of labour, which occurs more or less in all communities, either from parish laws, or the more general cause of the facility of combination among the rich, and its difficulty among the poor, operates to prevent the price of labour from rifing at the natural period, and keeps it down fome time longer; perhaps, till a year of scarcity, when the clamour is too loud, and the necessity too apparent to be refisted.

The true cause of the advance in the price of labour is thus concealed; and the rich affect to grant it as an act of compassion and favour to the poor, in confideration of a year of scarcity; and when plenty returns, indulge themselves in the most unreasonable of all complaints, that the price does not again sall; when a little reflection would shew them, that it must have risen long before, but from an unjust conspiracy of their own.

But though the rich by unfair combinations, contribute frequently to prolong a feason of distress among the poor; yet no possible form of society could prevent the almost constant action of misery, upon a great part of mankind, if in a state of inequality, and upon all, if all were equal.

The theory, on which the truth of this position depends, appears to me so extremely clear; that I seel at a loss to conjecture what part of it can be denied.

That population cannot increase without the means of subfishence, is a proposition so evident, that it needs no illustration.

That population does invariably increase, where there are the means of subfishence, the history of every people that have ever existed will abundantly prove.

And, that the fuperior power of population cannot be checked, without producing mifery or vice, the ample portion of these too bitter ingredients in the cup of human life, and the con-

tinuance of the physical causes that seem to have produced them, bear too convincing a testimony.

But in order more fully to afcertain the validity of these three propositions, let us examine the different states in which mankind have been known to exist. Even a cursory review will, I think, be sufficient to convince us, that these propositions are incontrovertible truths.

CHAP. III.

The savage or hunter state shortly reviewed.—The shepherd state, or the tribes of barbarians that overran the Roman Empire.—The superiority of the power of population to the means of subsistence—the cause of the great tide of Northern Emigration.

In the rudest state of mankind, in which hunting is the principal occupation, and the only mode of acquiring food; the means of fubfiftence being fcattered over a large extent of territory, the comparative population must necessarily be thin. It is faid, that the passion between the fexes is less ardent among the North American Indians, than among any other race of men. Yet notwithstanding this apathy, the effort towards population, even in this people, feems to be always greater than the means to support it. This appears, from

the comparatively rapid population that takes place, whenever any of the tribes happen to fettle in fome fertile spot, and to draw nourishment from more fruitful fources than that of hunting; and it has been frequently remarked, that when an Indian family has taken up its abode near any European fettlement, and adopted a more eafy and civilized mode of life, that one woman has reared five or fix, or more children; though in the favage state, it rarely happens, that above one or two in a family grow up to maturity. The fame obfervation has been made with regard to the Hottentots near the Cape. These facts prove the fuperior power of population to the means of subfistence in nations of hunters; and that this power always thews itself the moment it is left to act with freedom.

It remains to inquire, whether this power can be checked, and its effects kept equal to the means of fubfiftence, without vice, or mifery.

The North American Indians, confidered as a people, cannot justly be called free and equal. In all the accounts we have of them, and, indeed, of most other favage nations, the women are represented as much more completely in a state of slavery to the men, than the poor are to the rich in civilized countries. One half the nation appears to act as Helots to the other half: and the mifery that checks population falls chiefly, as it always must do, upon that part whose condition is lowest in the fcale of fociety. The infancy of man in the fimplest state requires considerable attention; but this necessary attention the women cannot give, condemned as they are, to the inconveniences and hardships of frequent change of place, and to the constant and unremitting drudgery of preparing every thing for the reception of their tyrannic lords. These exertions, sometimes, during pregnancy, or with children at their backs, must occasion frequent miscarriages, and prevent any but the most robust infants from growing to maturity. Add to these hardships of the women, the constant war that prevails among favages, and the necessity which they frequently labour under of expofing their aged and helpless parents, and of thus violating the first feelings of nature; and the picture will not appear very free from the blot of mifery. In estimating the happiness of a savage nation, we must not fix our eyes only on the warrior in the prime of life: he is one of a hundred: he is the gentleman, the man of fortune, the chances have been in his favour; and many efforts have failed ere this fortunate being was produced, whose guardian genius should preserve him through the numberless dangers with which he would be furrounded from infancy to manhood. The true points of comparison between two nations, feem to be, the ranks in each which appear nearest to answer to each other. And in this view, I should compare the warriors in the prime of life. with the gentlemen; and the women. children, and aged, with the lower classes of the community in civilized states.

May we not then fairly infer from this fhort review, or rather, from the accounts that may be referred to of nations of hunters; that their population is thin from the fearcity of food; that it would immediately increase if food was in greater plenty; and that, putting vice out of the question among savages, misery is the check that represses the superior power of population, and keeps its effects equal to the means of subsistence. Actual observation and experience, tell us that this check, with a few local and temporary exceptions, is constantly acting now upon all savage nations; and the theory indicates, that it probably acted with nearly equal strength a thousand years ago, and it may not be much greater a thousand years hence.

Of the manners and habits that prevail among nations of shepherds, the next state of mankind, we are even more ignorant than of the savage state. But that these nations could not escape the general lot of misery arising from the want of subsistence, Europe, and

all the fairest countries in the world. bear ample testimony. Want was the goad that drove the Scythian shepherds from their native haunts, like fo many famished wolves in search of prey. Set in motion by this all powerful cause, clouds of Barbarians feemed to collect from all points of the northern hemifphere. Gathering fresh darkness, and terror, as they rolled on, the congregated bodies at length obscured the funof Italy, and funk the whole world in univerfal night. These tremendous effects, fo long and fo deeply felt throughout the fairest portions of the earth, may be traced to the simple cause of the fuperior power of population, to the means of subfistence.

It is well known, that a country in pasture cannot support so many inhabitants as a country in tillage; but what renders

renders nations of shepherds fo formidable, is, the power which they possess of moving all together, and the necessity they frequently feel of exerting this power in fearch of fresh pasture for their herds. A tribe that was rich in cattle. had an immediate plenty of food. Even the parent stock might be devoured in a case of absolute necessity. The women lived in greater eafe than among nations of hunters. The men bold in their united strength, and confiding in their power of procuring pasture for their cattle by change of place, felt, probably, but few fears about providing for a family. These combined causes foon produced their natural and invariable effect, an extended population. A more frequent and rapid change of place became then necessary. A wider and more extensive territory was successively occupied. A broader defolation extended all around them. Want pinched the less fortunate members of the fociety: and, at length, the impossibility of supporting such a number together became too evident to be refifted. Young scions were then pushed out from the parent-flock, and instructed to explore fresh regions, and to gain happier feats for themselves by their swords. "The world was all before them where to chuse." Restless from present distress; flushed with the hope of fairer profpects; and animated with the spirit of hardy enterprize, these daring adventurers were likely to become formidable adverfaries to all who opposed them. The peaceful inhabitants of the countries on which they rushed, could not long withstand the energy of men acting under fuch powerful motives of exertion. And when they fell in with any tribes like their own, the contest was a struggle

struggle for existence; and they sought with a desperate courage, inspired by the reslection, that death was the punishment of descat, and life the prize of victory.

In these savage contests many tribes must have been utterly exterminated. Some, probably, perished by hardship and famine. Others, whose leading star had given them a happier direction, became great and powerful tribes; and, in their turns, fent off fresh adventurers in fearch of still more fertile feats. The prodigious waste of human life occasioned by this perpetual struggle for room and food, was more than supplied by the mighty power of population, acting, in some degree, unshackled, from the conftant habit of emigration. The tribes that migrated towards the South, though they won these more fruitful regions by continual battles, rapidly increased

in

in number and power, from the increafed means of sublistence. Till, at length, the whole territory, from the confines of China to the shores of the Baltic, was peopled by a various race of Barbarians, brave, robust, and enterprifing; inured to hardship, and delighting in war. Some tribes maintained their independence. Others ranged themthemselves under the standard of some barbaric chieftain, who led them to victory after victory; and what was of more importance, to regions abounding in corn, wine and oil, the long wished for confummation, and great reward of their labours. An Alaric, an Attila or a Zingis Khan, and the chiefs around them, might fight for glory, for the fame of extensive conquests; but the true cause that set in motion the great tide of northern emigration, and that continued to propel it till it rolled at different periods, against China, Persia, Italy, and even Egypt, was a scarcity of food, a population extended beyond the means of supporting it.

The absolute population at any one period, in proportion to the extent of territory, could never be great, on account of the unproductive nature of fome of the regions occupied: but there appears to have been a most rapid fuccession of human beings; and as fast as fome were moved down by the fcythe of war, or of famine, others rose in increafed numbers to fupply their place. Among these bold and improvident Barbarians, population was probably but little checked, as in modern states, from a fear of future difficulties. A prevailing hope of bettering their condition by change of place; a constant expectation of plunder; a power even, if difdistressed, of selling their children as slaves, added to the natural carelessness of the barbaric character, all conspired to raise a population which remained to be repressed afterwards by samine or war.

Where there is any inequality of conditions, and among nations of shepherds this foon takes place, the distress arising from a scarcity of provisions, must fall hardest upon the least fortunate members of the society. This distress also must frequently have been felt by the women, exposed to casual plunder in the absence of their husbands, and subject to continual disappointments in their expected return.

But without knowing enough of the minute and intimate history of these people, to point out precisely on what E 2 part

part the diffress for want of food chiefly fell; and to what extent it was generally felt; I think we may fairly say, from all the accounts that we have of nations of shepherds, that population invariably increased among them, whenever, by emigration, or any other cause, the means of sub-sistence were increased; and, that a further population was checked, and the actual population kept equal to the means of subsistence by misery and vice.

For, independently of any vicious cuftoms that might have prevailed amongft them with regard to women, which always operate as checks to population, it must be acknowledged, I think, that the commission of war is vice, and the effect of it, misery; and none can doubt the misery of want of food.

CHAP. IV.

State of civilized nations.—Probability that Europe is much more populous now than in the time of Julius Cæsar.—Best criterion of population.—Probable error of Hume in one of the criterions that he proposes as assisting in an estimate of population.—Slow increase of population at present in most of the states of Europe.—The two principal checks to population. The first or preventive check examined with regard to England.

In examining the next state of mankind with relation to the question before us, the state of mixed pasture and tillage, in which, with some variation in the proportions, the most civilized nations must always remain; we shall be assisted in our review by what we daily see around us, by actual experience, by facts that come within the scope of every man's observation.

Notwithstanding the exaggerations of some old historians, there can remain

no doubt in the mind of any thinking man, that the population of the principal countries of Europe, France, England, Germany, Russia, Poland, Sweden, and Denmark, is much greater than ever it was in former times. The obvious reason of these exaggerations, is, the formidable aspect that even a thinly peopled nation must have, when collected together, and moving all at once in fearch of fresh feats. If to this tremendous appearance be added a fuccession at certain intervals of similar emigrations, we shall not be much furprifed that the fears of the timid nations of the South, represented the North as a region abfolutely fwarming with human beings. A nearer and juster view of the subject at present, enables us to fee, that the inference was as abfurd, as if a man in this country, who was continually meeting on the road

road droves of cattle from Wales and the North, was immediately to conclude that these countries were the most productive of all the parts of the kingdom.

The reason that the greater part of Europe is more populous now than it was in former times, is, that the induftry of the inhabitants has made thefe countries produce a greater quantity of human fublistence. For, I conceive, that it may be laid down as a position not to be controverted, that, taking a fufficient extent of territory to include within it exportation and importation; and allowing fome variation for the prevalence of luxury, or of frugal habits; that population constantly bears a regular proportion to the food that the earth is made to produce. In the controverfy concerning the populousness of an-E 4 cient

cient and modern nations, could it be clearly afcertained that the average produce of the countries in question, taken altogether, is greater now than it was in the times of Julius Cæsar, the dispute would be at once determined.

When we are affured that China is the most fertile country in the world; that almost all the land is in tillage; and that a great part of it bears two crops every year; and further, that the people live very frugally, we may infer with certainty, that the population must be immense, without bufying ourselves in inquiries into the manners and habits of the lower classes, and the encouragements to early marriages. But thefe inquiries, are of the utmost importance, and a minute history of the customs of the lower Chinese would be of the greatest use, in ascertaining in what man-

ances.

manner the checks to a further population operate; what are the vices, and what are the diffresses that prevent an increase of numbers beyond the ability of the country to support.

Hume, in his effay on the populoufness of ancient and modern nations, when he intermingles, as he fays, an inquiry concerning causes, with that concerning facts, does not feem to fee with his usual penetration, how very little fome of the causes he alludes to could enable him to form any judgment of the actual population of ancient nations. If any inference can be drawn from them, perhaps it should be directly the reverse of what Hume draws, though I certainly ought to speak with great diffidence in diffenting from a man, who of all others on fuch subjects was the least likely to be deceived by first appearances. If I find that at a certain period in ancient history, the encourage-ments to have a family were great, that early marriages were confequently very prevalent, and that few persons remained fingle, I should infer with certainty that population was rapidly increasing, but by no means that it was then actually very great; rather, indeed, the contrary, that it was then thin, and that there was room and food for a much greater number. On the other hand, if I find that at this period the difficulties attending a family were very great; that, consequently, few early marriages took place, and that a great number of both fexes remained fingle, I infer with certainty that population was at a stand; and, probably, because the actual population was very great in proportion to the fertility of the land, and that there was fcarcely room and food for more. The

The number of footmen, housemaids. and other persons remaining unmarried in modern states. Hume allows to be rather an argument against their population. I should rather draw a contrary inference, and confider it an argument of their fullness; though this inference is not certain, because there are many thinly inhabited states that are yet stationary in their population. To speak. therefore, correctly, perhaps it may be faid, that the number of unmarried perfons in proportion to the whole number, existing at different periods, in the fame, or different states, will enable us to judge whether-population at these periods, was increasing, stationary, or decreafing, but will form no criterion by which we can determine the actual population.

There is, however, a circumstance taken notice of in most of the accounts we have of China, that it feems difficult to reconcile with this reasoning. It is faid, that early marriages very generally prevail through all the ranks of the Chinefe. Yet Dr. Adam Smith fuppofes that population in China is stationary. These two circumstances appear to be irreconcileable. It certainly feems very little probable that the population of China is fast increasing. Every acre of land has been fo long in cultivation, that we can hardly conceive there is any great yearly addition to the average produce. The fact, perhaps, of the universality of early marriages may not be fufficiently afcertained. If it be supposed true, the only way of accounting for the difficulty, with our present knowledge of the fubject, appears to be, that the redun-

dant

dant population, necessarily occasioned by the prevalence of early marriages, must be repressed by occasional famines, and by the custom of exposing children, which, in times of diffress, is probably more frequent than is ever acknowledged to Europeans. Relative to this barbarous practice, it is difficult to avoid remarking, that there cannot be a stronger proof of the distresses that have been felt by mankind for want of food, than the existence of a custom that thus violates the most natural principle of the human heart. It appears to have been very general among ancient nations, and certainly tended rather to increase population.

In examining the principal states of modern Europe, we shall find, that though they have increased very considerably in population since they were nations

nations of shepherds, yet that, at prefent, their progress is but flow; and instead of doubling their numbers every twentyfive years, they require three or four hundred years, or more, for that purpofe. Some, indeed, may be abfolutely stationary, and others even retrograde. The cause of this flow progress in population cannot be traced to a decay of the passion between the sexes. We have fufficient reason to think that this natural propenfity exists still in undiminished vigour. Why then do not its effects appear in a rapid increase of the human species? An intimate view of the state of society in any one country in Europe, which may ferve equally for all, will enable us to answer this question, and to fay, that a forefight of the difficulties attending the rearing of a family, acts as a preventive check; and the actual diffresses of some of the lower

lower classes, by which they are disabled from giving the proper food and attention to their children, acts as a positive check, to the natural increase of population.

England, as one of the most flourishing states of Europe, may be fairly taken for an example, and the observations made, will apply with but little variation to any other country where the population increases slowly.

The preventive check appears to operate in some degree through all the ranks of society in England. There are some men, even in the highest rank, who are prevented from marrying by the idea of the expences that they must retrench, and the fancied pleasures that they must deprive themselves of, on the supposition of having a family. These

confiderations are certainly trivial; but a preventive forefight of this kind has objects of much greater weight for its contemplation as we go lower.

A man of liberal education, but with an income only just sufficient to enable him to affociate in the rank of gentlemen, must feel absolutely certain, that if he marries and has a family, he shall be obliged, if he mixes at all in fociety, to rank himself with moderate farmers, and the lower class of tradefmen. The woman that a man of education would naturally make the object of his choice, would be one brought up in the same tastes and sentiments with himself, and used to the familiar intercourse of a society totally different from that to which she must be reduced by marriage. Can a man confent to place the object of his affection

tion in a fituation fo discordant, probably, to her tastes and inclinations? Two or three steps of descent in society, particularly at this round of the ladder, where education ends, and ignorance begins, will not be confidered by the generality of people, as a fancied and chimerical, but a real and effential evil. If fociety be held defireable, it furely must be free, equal, and reciprocal fociety, where benefits are conferred as well as received; and not fuch as the dependent finds with his patron, or the poor with the rich.

These considerations undoubtedly prevent a great number in this rank of life from following the bent of their inclinations in an early attachment. Others, guided either by a stronger passion, or a weaker judgment, break through these restraints; and it would be hard indeed,

if the gratification of fo delightful a passion as virtuous love, did not, sometimes, more than counterbalance all its attendant evils. But I fear it must be owned, that the more general consequences of such marriages, are rather calculated to justify, than to repress, the forebodings of the prudent.

The fons of tradefmen and farmers are exhorted not to marry, and generally find it necessary to pursue this advice, till they are settled in some business, or farm, that may enable them to support a family. These events may not, perhaps, occur till they are far advanced in life. The scarcity of farms is a very general complaint in England. And the competition in every kind of business is so great, that it is not possible that all should be successful.

The labourer who earns eighteen pence a day, and lives with some degree of comfort as a fingle man, will hefitate a little before he divides that pittance among four or five, which feems to be but just sufficient for one. Harder fare and harder labour he would fubmit to, for the fake of living with the woman that he loves; but he must feel conscious, if he thinks at all, that, should he have a large family, and any ill luck whatever, no degree of frugality, no possible exertion of his manual strength, could preferve him from the heart rending fensation of seeing his children starve, or of forfeiting his independence, and being obliged to the parish for their support. The love of independence is a fentiment that furely none would wish to be erased from the breast of man: though the parish law of England, it must be confessed, is a F 2 fystem fyftem of all others the most calculated gradually to weaken this sentiment, and in the end, may eradicate it completely.

The fervants who live in gentlemens' families, have restraints that are yet stronger to break through, in venturing upon marriage. They possess the necesfaries, and even the comforts of life, almost in as great plenty as their masters. Their work is eafy, and their food luxurious, compared with the class of labourers. And their fense of dependence is weakened by the conscious power of changing their mafters, if they feel themselves offended. Thus comfortably fituated at prefent, what are their prospects in marrying. Without knowledge or capital, either for business, or farming, and unused, and therefore unable

unable to earn a fubfiftence by daily labour, their only refuge feems to be a miferable ale house, which certainly offers no very enchanting prospect of a happy evening to their lives. By much the greater part, therefore, deterred by this uninviting view of their future situation, content themselves with remaining single where they are,

If this sketch of the state of society in England be near the truth, and I do not conceive that it is exaggerated, it will be allowed, that the preventive check to population in this country operates, though with varied force, through all the classes of the community. The same observation will hold true with regard to all old states. The effects, indeed, of these restraints upon marriage are but too conspicuous in the

confequent vices that are produced in almost every part of the world; vices, that are continually involving both fexes in inextricable unhappiness.

CHAP. V.

The second, or positive check to population examined, in England.—The true cause why the immense sum collected in England for the poor does not better their condition.—The powerful tendency of the poor laws to defeat their own purpose.—Palliative of the distresses of the poor proposed.—The absolute impossibility from the fixed laws of our nature, that the pressure of want can ever be completely removed from the lower classes of society.—All the checks to population may be resolved into misery or vice.

The positive check to population, by which I mean, the check that represses an increase which is already begun, is confined chiefly, though not perhaps solely, to the lowest orders of society. This check is not so obvious to common view as the other I have mentioned; and, to prove distinctly the force and extent of its operation, would require, perhaps, more data than we are in possession of. But I believe it has been

very generally remarked by those who have attended to bills of mortality, that of the number of children who die annually, much too great a proportion belongs to those, who may be supposed unable to give their offspring proper food and attention; exposed as they are occasionally to severe distress, and confined, perhaps, to unwholesome habitations and hard labour. This mortality among the children of the poor has been constantly taken notice of in all towns. It certainly does not prevail in an equal degree in the country; but the fubject has not hitherto received fufficient attention to enable any one to fay; that there are not more deaths in proportion, among the children of the poor, even in the country, than among those of the middling and higher classes. Indeed, it seems difficult to suppose that a labourer's wife who has fix children,

children, and who is fometimes in abfolute want of bread, should be able always to give them the food and attention necessary to support life. The sons and daughters of peafants will not be found fuch rofy cherubs in real life, as they are described to be in romances. It cannot fail to be remarked by those who live much in the country, that the fons of labourers are very apt to be flunted in their growth, and are a long while arriving at maturity. Boys that you would guess to be fourteen or fifteen, are upon inquiry, frequently found to be eighteen or nineteen. And the lads who drive plough, which must certainly be a healthy exercise, are very rarely feen with any appearance of calves to their legs; a circumstance, which can only be attributed to a want either of proper, or of sufficient nourishment.

To remedy the frequent distresses of the common people, the poor laws of England have been instituted; but it is to be feared, that though they may have alleviated a little the intenfity of individual misfortune, they have fpread the general evil over a much larger furface. It is a subject often started in converfation, and mentioned always as a matter of great furprise, that notwithstanding the immense sum that is annually collected for the poor in England, there is still to much distress among them. Some think that the money must be embezzled; others that the churchwardens and overfeers confume the greater part of it in dinners. All agree that fome how or other it must be very illmanaged. In fhort the fact, that nearly three millions are collected annually for the poor, and yet that their diftreffes are not removed, is the subject

of continual aftonishment. But a man who sees a little below the surface of things, would be very much more astonished, if the fact were otherwise than it is observed to be, or even if a collection universally of eighteen shillings in the pound instead of four, were materially to alter it. I will state a case which I hope will elucidate my meaning.

Suppose, that by a subscription of the rich, the eighteen pence a day which men earn now, was made up five shillings, it might be imagined, perhaps, that they would then be able to live comfortably, and have a piece of meat every day for their dinners. But this would be a very salse conclusion. The transfer of three shillings and sixpence a day to every labourer, would not increase the quantity of meat in the country. There is not at present enough

for all to have a decent share. What would then be the confequence? The competition among the buyers in the market of meat, would rapidly raife the price from fix pence or feven pence, to two or three shillings in the pound; and the commodity would not be divided among many more than it is at prefent. When an article is fcarce, and cannot be distributed to all, he that can fhew the most valid patent, that is, he that offers most money becomes the possession. If we can suppose the competition among the buyers of meat to continue long enough for a greater number of cattle to be reared annually. this could only be done at the expence of the corn, which would be a very difadvantageous exchange; for it is well known that the country could not then fupport the fame population; and when subfistence is scarce in proportion to the number of people, it is of little confequence whether the lowest members of the society possess eighteen pence or five shillings. They must at all events be reduced to live upon the hardest fare, and in the smallest quantity.

It will be faid, perhaps, that the increafed number of purchasers in every article, would give a four to productive industry, and that the whole produce of the island would be increased. This might in fome degree be the case. But the spur that these sancied riches would give to population, would more than counterbalance it, and the increased produce would be to be divided among a more than proportionably increased number of people. All this time I am supposing that the same quantity of work would be done as before. But this would not really take place.

place. The receipt of five shillings a day, instead of eighteen pence, would make every man fancy himself comparatively rich, and able to indulge himself in many hours or days of leisure. This would give a strong and immediate check to productive industry; and in a short time, not only the nation would be poorer, but the lower classes themselves would be much more distressed than when they received only eighteen pence a day.

A collection from the rich of eighteen shillings in the pound, even if distributed in the most judicious manner, would have a little the same effect as that resulting from the supposition I have just made; and no possible contributions or facrifices of the rich, particularly in money, could for any time prevent the recurrence of distress among

the lower members of fociety whoever they were. Great changes might, indeed, be made. The rich might become poor, and fome of the poor rich: but a part of the fociety must necessarily feel a difficulty of living; and this difficulty will naturally fall on the least fortunate members.

It may at first appear strange, but I believe it is true, that I cannot by means of money raise a poor man, and enable him to live much better than he did before, without proportionably depressing others in the same class. If I retrench the quantity of food confumed in my house, and give him what I have cut off, I then benefit him, without depressing any but myself and samily, who, perhaps, may be well able to bear it. If I turn up a piece of uncultivated land, and give him the produce, I then

benefit both him, and all the members of the fociety, because what he before confumed is thrown into the common stock, and probably some of the new produce with it. But if I only give him money, fuppofing the produce of the country to remain the fame, I give him a title to a larger share of that produce than formerly, which share he cannot receive without diminishing the shares of others. It is evident that this effect, in individual instances, must be fo fmall as to be totally imperceptible; but still it must exist, as many other effects do, which like fome of the infects that people the air, elude our groffer perceptions.

Supposing the quantity of food in any country to remain the same for many years together; it is evident that this food must be divided according to the value

value of each man's patent *, or the fum of money that he can afford to fpend in this commodity fo univerfally in request. It is a demonstrative truth therefore, that the patents of one fet of men could not be increased in value, without diminishing the value of the patents of fome other fet of men. If the rich were to fubscribe, and give five shillings a day to five hundred thousand men without retrenching their own tables, no doubt can exist, that as these men would naturally live more at their eafe, and confume a greater quantity of provisions, there would be lefs food remaining to divide among the rest; and consequently each man's patent would be diminished

^{*} Mr. Godwin calls the wealth that a man receives from his ancestors a mouldy patent. It may, I think, very properly be termed a patent; but I hardly see the propriety of calling it a mouldy one, as it is an article in such constant use.

in value, or the fame number of pieces of filver would purchase a smaller quantity of subfishence.

An increase of population without a proportional increase of food, will evidently have the fame effect in lowering the value of each man's patent. The food must necessarily be distributed in fmaller quantities, and confequently a day's labour will purchase a smaller quantity of provisions. An increase in the price of provisions would arife, either from an increase of population faster than the means of fublistence; or from a different distribution of the money of the fociety. The food of a country that has been long occupied, if it be increafing, increases slowly and regularly, and cannot be made to answer any fudden demands; but variations in the diftribution of the money of a fociety are

fequently

not unfrequently occurring, and are undoubtedly among the causes that occasion the continual variations which we observe in the price of provisions.

The poor-laws of England tend to depress the general condition of the poor in thefe two ways. Their first obvious tendency is to increase population without increasing the food for its support. A poor man may marry with little or no prospect of being able to support a family in independence. They may be faid therefore in some measure to create the poor which they maintain; and as the provisions of the country must, in confequence of the increased population, be distributed to every man in smaller proportions, it is evident that the labour of those who are not supported by parish assistance, will purchase a smaller quantity of provisions than before, and con-

G 2

fequently, more of them must be driven to ask for support.

Secondly, the quantity of provisions confumed in workhouses upon a part of the fociety, that cannot in general be confidered as the most valuable part, diminishes the shares that would otherwife belong to more industrious, and more worthy members; and thus in the fame manner forces more to become dependent. If the poor in the workhouses were to live better than they now do, this new distribution of the money of the fociety would tend more conspicuously to depress the condition of those out of the workhouses, by occasioning a rife in the price of provisions.

Fortunately for England, a spirit of independence still remains among the peasantry. The poor-laws are strongly

felves.

calculated to eradicate this spirit. They have succeeded in part; but had they succeeded as completely as might have been expected, their pernicious tendency would not have been so long concealed.

Hard as it may appear in individual instances, dependent poverty ought to be held difgraceful. Such a stimulus feems to be absolutely necessary to promote the happiness of the great mass of mankind; and every general attempt to weaken this stimulus, however benevolent its apparent intention, will always defeat its own purpose. If men are induced to marry from a prospect of parish provision, with little or no chance of maintaining their families in independence, they are not only unjustly tempted to bring unhappiness and dependence upon themselves and children; but they are tempted, without knowing it, to injure all in the same class with themfelves. A labourer who marries without being able to support a family, may in some respects be considered as an enemy to all his fellow-labourers.

I feel no doubt whatever, that the parish laws of England have contributed to raife the price of provisions, and to lower ! the real price of labour. They have therefore contributed to impoverish that class of people whose only possession is their labour. It is also difficult to suppose that they have not powerfully contributed to generate that carelefness, and want of frugality observable among the poor, so contrary to the disposition frequently to be remarked among petty tradefmen and fmall farmers. The labouring poor, to use a vulgar expression, seem always to live from hand to mouth. Their present wants employ their whole attention, and they feldom think of the future. Even when they have an opportunity of faving

they

they feldom exercife it; but all that is beyond their prefent necessities goes, generally speaking, to the ale-house. The poor-laws of England may therefore be said to diminish both the power and the will to save, among the common people, and thus to weaken one of the strongest incentives to sobriety and industry, and consequently to happiness.

It is a general complaint among master manufacturers, that high wages ruin all their workmen; but it is difficult to conceive that these men would not save a part of their high wages for the suture support of their families, instead of spending it in drunkenness and dissipation, if they did not rely on parish assistance for support in case of accidents. And that the poor employed in manufactures consider this assistance as a reason why they may spend all the wages they earn, and

enjoy themselves while they can, appears to be evident from the number of families that, upon the failure of any great manufactory, immediately fall upon the parish; when perhaps the wages earned in this manufactory, while it flourished, were sufficiently above the price of common country labour, to have allowed them to save enough for their support, till they could find some other channel for their industry.

A man who might not be deterred from going to the ale-house, from the consideration that on his death, or sickness, he should leave his wife and family upon the parish, might yet hesitate in thus dissipating his earnings, if he were assured that, in either of these cases, his family must starve, or be left to the support of casual bounty. In China, where the real as well as nominal price of labour is

very low, fons are yet obliged by law to fupport their aged and helpless parents. Whether such a law would be adviseable in this country, I will not pretend to determine. But it seems at any rate highly improper, by positive institutions, which render dependent poverty so general, to weaken that disgrace, which for the best and most humane reasons ought to attach to it.

The mass of happiness among the common people cannot but be diminished, when one of the strongest checks to idleness and dissipation is thus removed; and when men are thus allured to marry with little or no prospect of being able to maintain a family in independence. Every obstacle in the way of marriage must undoubtedly be considered as a species of unhappiness. But as from the laws of our nature some check to population

lation must exist, it is better that it should be checked from a foresight of the difficulties attending a family, and the sear of dependent poverty, than that it should be encouraged, only to be repressed afterwards by want and sickness.

It should be remembered always, that there is an essential difference between food, and those wrought commodities, the raw materials of which are in great plenty. A demand for these last will not fail to create them in as great a quantity as they are wanted. The demand for food has by no means the same creative power. In a country where all the fertile spots have been seized, high offers are necessary to encourage the farmer to lay his dressing on land, from which he cannot expect a profitable return for some years. And before the

prospect of advantage is sufficiently great to encourage this fort of agricultural enterprize, and while the new produce is rising, great distresses may be suffered from the want of it. The demand for an increased quantity of subsistence is, with sew exceptions, constant every where, yet we see how slowly it is answered in all those countries that have been long occupied.

The poor-laws of England were undoubtedly instituted for the most benevolent purpose; but there is great reason to think that they have not succeeded in their intention. They certainly mitigate some cases of very severe distress which might otherwise occur; yet the state of the poor who are supported by parishes, considered in all its circumstances, is very far from being free from misery. But one of the principal objections to them

them is, that for this assistance which some of the poor receive, in itself almost a doubtful blefsing, the whole class of the common people of England, is fubjected to a fet of grating, inconvenient, and tyrannical laws, totally inconfiftent with the genuine spirit of the constitution. The whole business of settlements. even in its prefent amended state, is utterly contradictory to all ideas of free-The parish persecution of men whose families are likely to become chargeable, and of poor women who are near lying-in, is a most difgraceful and difgusting tyranny. And the obstructions continually occasioned in the market of labour by these laws, have a constant tendency to add to the difficulties of those who are struggling to support themselves without assistance.

These evils attendant on the poor-laws, are in some degree irremediable. If assistance be to be distributed to a certain class of people, a power must be given somewhere of difcriminating the proper objects, and of managing the concerns of the institutions that are necessary; but any great interference with the affairs of other people, is a species of tyranny; and in the common course of things, the exercise of this power may be expected to become grating to those who are driven to ask for support. The tyranny of Justices, Churchwardens, and Overfeers, is a common complaint among the poor: but the fault does not lie fo much in these persons, who probably before they were in power, were not worfe than other people; but in the nature of all fuch institutions.

The evil is perhaps gone too far to be remedied; but I feel little doubt in my own mind, that if the poor-laws had never existed, though there might have been a few more instances of very severe distress, yet that the aggregate mass of happiness among the common people would have been much greater than it is at present.

Mr. Pitt's Poor-bill has the appearance of being framed with benevolent intentions, and the clamour raifed against it was in many respects ill directed, and unreasonable. But it must be confessed that it possesses in a high degree the great and radical desect of all systems of the kind, that, of tending to increase population without increasing the means for its support, and thus to depress the condition of those that are not supported

by parishes, and, consequently, to create more poor.

To remove the wants of the lower classes of fociety, is indeed an arduous task. The truth is, that the pressure of distress on this part of a community is an evil fo deeply feated, that no human ingenuity can reach it. Were I to propofe a palliative; and palliatives are all that the nature of the case will admit; it should be, in the first place, the total abolition of all the prefent parish-laws. This would at any rate give liberty and freedom of action to the peafantry of England, which they can hardly be faid to possess at prefent. They would then be able to fettle without interruption, wherever there was a prospect of a greater plenty of work, and a higher price for labour. The market of labour would then be free, and those obstacles removed, which as things are now, often for a confiderable time prevent the price from rifing according to the demand.

Secondly, Premiums might be given for turning up fresh land, and all possible encouragements held out to agriculture above manufactures, and to tillage above grazing. Every endeavour should be used to weaken and destroy all those institutions relating to corporations, apprenticefhips, &c. which cause the labours of agriculture to be worfe paid than the labours of trade and manufactures. For a country can never produce its proper quantity of food while these distinctions remain in favour of artizans. Such encouragements to agriculture would tend to furnish the market with an increasing quantity of healthy work, and at the fame time, by augmenting the produce of the country, would raife the compara-

tive

tive price of labour, and ameliorate the condition of the labourer. Being now in better circumstances, and seeing no prospect of parish assistance, he would be more able, as well as more inclined, to enter into associations for providing against the sickness of himself or samily.

Laftly, for cases of extreme distress, county workhouses might be established, supported by rates upon the whole kingdom, and free for persons of all counties, and indeed of all nations. The fare should be hard, and those that were able obliged to work. It would be desireable, that they should not be considered as comfortable asylums in all difficulties; but merely as places where severe distress might find some alleviation. A part of these houses might be separated, or others built for a most beneficial pur-

pose, which has not been unstrequently taken notice of, that of providing a place, where any person, whether native or foreigner, might do a day's work at all times, and receive the market price for it. Many cases would undoubtedly be left for the exertion of individual benevolence.

A plan of this kind, the preliminary of which, should be an abolition of all the present parish laws, scems to be the best calculated to increase the mass of happiness among the common people of England. To prevent the recurrence of misery, is, alas! beyond the power of man. In the vain endeavour to attain what in the nature of things is impossible, we now facrisice not only possible, but certain benefits. We tell the common people, that if they will submit to a code of tyrannical regulations, they shall

never be in want. They do submit to these regulations. They perform their part of the contract: but we do not, nay cannot, perform ours: and thus the poor facrisce the valuable blessing of liberty, and receive nothing that can be called an equivalent in return.

Notwithstanding then, the institution of the poor-laws in England, I think it will be allowed, that considering the state of the lower classes altogether, both in the towns and in the country, the distresses which they suffer from the want of proper and sufficient food, from hard labour and unwholesome habitations, must operate as a constant check to incipient population.

To these two great checks to population, in all long occupied countries, which I have called the preventive and

H 2 the

the positive checks, may be added, vicious customs with respect to women, great cities, unwholesome manusactures, luxury, pestilence, and war.

All these checks may be fairly resolved into misery and vice.

And that these are the true causes of the slow increase of population in all the states of modern Europe, will appear sufficiently evident, from the comparatively rapid increase that has invariably taken place, whenever these causes have been in any considerable degree removed.

CHAP. VI.

New colonies.—Reasons of their rapid increase.—North American Colonies.—Extraordinary instance of increase in the back settlements.—Rapidity with which even old states recover the ravages of war, pestilence, famine, or the convulsions of nature.

It has been univerfally remarked, that all new colonies fettled in healthy countries, where there was plenty of room and food, have constantly increased with aftonishing rapidity in their population. Some of the colonies from ancient Greece, in no very long period, more than equalled their parent states in numbers and strength. And not to dwell on remote instances, the European settlements in the new world bear ample testimony to the truth of a remark, which, indeed, has never, that I know of, been doubted. A plenty of rich land,

to be had for little or nothing, is fo powerful a cause of population, as to overcome all other obstacles. No settlements could well have been worfe managed than those of Spain in Mexico, Peru, and Quito. The tyranny, superstition, and vices, of the mother-country. were introduced in ample quantities among her children. Exorbitant taxes were exacted by the Crown. The most arbitrary restrictions were imposed on their trade. And the governors were not behind hand in rapacity and extortion for themselves as well as their master. Yet, under all these difficulties, the colonies made a quick progress in population. The city of Lima, founded fince the conquest, is represented by Ulloa as containing fifty thousand inhabitants near fifty years ago. Quito, which had been but a hamlet of Indians, is reprefented by the fame author as in his time

time equally populous. Mexico is faid to contain a hundred thousand inhabitants, which, notwithstanding the exaggerations of the Spanish writers, is supposed to be five times greater than what it contained in the time of Montezuma.

In the Portuguese colony of Brasil, governed with almost equal tyranny, there were supposed to be, thirty years since, six hundred thousand inhabitants of European extraction.

The Dutch and French colonies, though under the government of exclusive companies of merchants, which, as Dr. Adam Smith says very justly, is the worst of all possible governments, still persisted in thriving under every disadvantage.

But the English North American colonies, now, the powerful People of the United States of America, made by far the most rapid progress. To the plenty of good land which they poffeffed in common with the Spanish and Portuguese fettlements, they added a greater degree of liberty and equality. Though not without fome restrictions on their foreign commerce, they were allowed a perfect liberty of managing their own internal affairs. The political inftitutions that prevailed were favourable to the alienation and division of property. Lands that were not cultivated by the proprietor within a limited time, were declared grantable to any other perfon. In Penfylvania there was no right of primogeniture; and in the provinces of New England, the eldeft had only a double share. There were no tythes in any of the States, and fcarcely

fearcely any taxes. And on account of the extreme cheapness of good land, a capital could not be more advantageously employed than in agriculture, which at the same time that it supplies the greatest quantity of healthy work, affords much the most valuable produce to the society.

The confequence of these favourable circumstances united, was a rapidity of increase, probably without parallel in history. Throughout all the northern colonies, the population was found to double itself in 25 years. The original number of persons who had settled in the four provinces of new England in 1643, was 21,200*. Afterwards, it is supposed,

^{*} I take these facts from Dr. Price's two volumes of Observations, not having Dr. Styles's pamphlet, from which he quotes, by me.

that more left them, than went to them. In the year 1760, they were increased to half a million. They had therefore all along doubled their own number in 25 years. In new Jersey the period of doubling appeared to be 22 years; and in Rhode Island still less. In the back settlements, where the inhabitants applied themselves solely to agriculture, and luxury was not known, they were found to double their own number in 15 years, a most extraordinary instance of increase*. Along the sea coast, which would

* In instances of this kind, the powers of the earth appear to be fully equal to answer all the demands for food that can be made upon it by man. But we should be led into an error, if we were thence to suppose that population and food ever really increase in the same ratio. The one is still a geometrical and the other an arithmetical ratio, that is, one increases by multiplication, and the other by addition. Where there are sew people, and a great quantity of sertile land.

would naturally be first inhabited, the period of doubling was about 35 years; and in some of the maritime towns, the population was absolutely at a stand.

These facts seem to shew that population increases exactly in the proportion, that the two great checks to it, misery

land, the power of the earth to afford a yearly increase of food may be compared to a great refervoir of water. supplied by a moderate stream. The faster population increases, the more help will be got to draw off the water, and confequently an increasing quantity will be taken every year. But the sqoner, undoubtedly, will the refervoir be exhausted, and the streams only remain. When acre has been added to acre, till all the fertile land is occupied, the yearly increase of food will depend upon the amelioration of the land already in possession; and even this moderate stream will be gradually diminishing. But population, could it be supplied with food, would go on with unexhausted vigour, and the increase of one period would furnish the power of a greater increase the next, and this without any limit,

and vice, are removed; and that there is not a truer criterion of the happiness and innocence of a people, than the rapidity of their increase. The unwholefomeness of towns, to which some perfons are necessarily driven, from the nature of their trades, must be considered as a species of misery; and every the flightest check to marriage, from a profpect of the difficulty of maintaining a family, may be fairly classed under the fame head. In short, it is difficult to conceive any check to population, which does not come under the description of some species of misery or vice.

The population of the thirteen American States before the war, was reckoned at about three millions. Nobody imagines, that Great Britain is lefs populous at prefent for the emigration of the finall parent flock that produced these numbers.

On the contrary, a certain degree of emigration, is known to be favourable to the population of the mother country. It has been particularly remarked, that the two Spanish provinces from which the greatest number of people emigrated to America, became in confequence more populous. Whatever was the original number of British Emigrants that increafed fo fast in the North American Colonies; let us ask, why does not an equal number produce an equal increase. in the fame time, in Great Britain? The great and obvious cause to be assigned, is, the want of room and food, or, in other words, mifery; and that this is a much more powerful cause even than vice, appears fufficiently evident from the rapidity with which even old States recover the defolations of war, peftilence, or the accidents of nature. They are then for a short time placed a little in

the fituation of new states; and the effect is always answerable to what might be expected. If the industry of the inhabitants be not destroyed by sear or tyranny, subsistence will soon increase beyond the wants of the reduced numbers; and the invariable consequence will be, that population which before, perhaps, was nearly stationary, will begin immediately to increase.

The fertile province of Flanders, which has been fo often the feat of the most destructive wars, after a respite of a few years, has appeared always as fruitful and as populous as ever. Even the Palatinate listed up its head again after the execrable ravages of Lewis the Fourteenth. The effects of the dreadful plague in London in 1666, were not perceptible 15 or 20 years afterwards. The traces of the most destructive families in China

China and Indostan, are by all accounts very foon obliterated. It may even be doubted whether Turkey and Egypt are upon an average much less populous, for the plagues that periodically lay them waste. If the number of people which they contain be less now than formerly, it is, probably, rather to be attributed to the tyranny and oppression of the government under which they groan, and the confequent difcouragements to agriculture, than to the loss which they fuftain by the plague. The most tremendous convulsions of nature, such as volcanic eruptions and earthquakes, if they do not happen so frequently as to drive away the inhabitants, or to destroy their spirit of industry, have but a trisling effect on the average population of any state. Naples, and the country under Vefuvius, are still very populous, notwithstanding the repeated eruptions of that

mountain. And Lisbon and Lima are now, probably, nearly in the same state with regard to population, as they were before the last earthquakes.

CHAP. VII.

A probable cause of epidemics.—Extracts from Mr. Susmilch's tables.—Periodical returns of sickly seasons to be expected in certain cases.—Proportion of births to burials for short periods in any country un inadequate criterion of the real average increase of population.—Best criterion of a permanent increase of population.—Great frugality of living one of the causes of the famines of China and Indostan.—Evil tendency of one of the clauses in Mr. Pitt's Poor Bill.—Only one proper way of encouraging populaiion.—Causes of the happiness of nations.—Famine, the last and most dreadful mode by which nature represses a redundant population.—The three propositions considered as established.

By great attention to cleanliness, the plague seems at length to be completely expelled from London. But it is not improbable, that among the secondary causes that produce even sickly scasons and epidemics, ought to be ranked, a crowded population and unwholesome and insufficient food. I have been led

to this remark, by looking over some of the tables of Mr. Susmilch, which Dr. Price has extracted in one of his notes to the postscript on the controversy respecting the population of England and Wales. They are considered as very correct; and if such tables were general, they would throw great light on the different ways by which population is repressed, and prevented from increasing beyond the means of subsistence in any country. I will extract a part of the tables, with Dr. Price's remarks.

In the Kingdom of Prussia, and Duke-dom of Lithuania.

Annual Average.	Births.			Proportion of Births to Marriages.	
10 Yrs. to 1702	21963	14718	5928	37 to 10	150 to 100
5 Yrs. to 1716					180 to 100
5 Yrs. to 1756	28392	19154	5599	50 to 10	148 to 100

" N. B. In 1709 and 1710, a pestilence carried off 247,733 of the inhabi-

tants of this country, and in 1736 and 1737, epidemics prevailed, which again checked its increase."

It may be remarked, that the greatest proportion of births to burials, was in the five years after the great pestilence.

Dutchy of Pomerania.

Annual Average.	Births.	Burials.		Proportion of Birthsto Marriages.	of Births to
6 Yrs. to 1702	6540	. 4647	1810	36 to 10	140 to 100
6 Yrs. to 1708					177 to 100
6 Yrs. to 1726	8432	5627	2131	39 to 10	150 to 100
4 Yrs. to 1756	12767	9281	2957	43 to 10	137 to 100

"In this inftance the inhabitants appear to have been almost doubled in 56 years, no very bad epidemics having once interrupted the increase, but the three years immediately following the last period (to 1759,) were years so sickly that the births were sunk to 10,229, and the burials raised to 15,068."

Is it not probable, that in this case, the number of inhabitants had increased faster than the food and the accommodations necessary to preserve them in health. The mass of the people would, upon this supposition, be obliged to live harder, and a greater number would be crouded together in one house; and it is not furely improbable, that thefe were among the natural causes that produced the three fickly years. These causes may produce such an effect, though the country, absolutely confidered, may not be extremely crowded and populous. In a country even thinly inhabited, if an increase of population take place, before more food is raifed, and more houses are built, the inhabitants must be distressed in some degree for room and fubfiftence. Were the marriages in England, for the next eight or ten years, to be more prolifick than usual, or even were a greater number of

marriages than usual to take place, suppoling the number of houses to remain the fame; instead of five or fix to a cottage, there must be seven or eight; and this, added to the necessity of harder living, would probably have a very unfavourable effect on the health of the common people.

Neumark of Brandenburgh.

Annual Average.	Births.	Burials.	Mar- riages.	Proportion of Births to Marriages.	Proportion of Births to Burials.
5 Yrs. to 1701	5433.	3483	1436	37 to 10	155 to 100
5 Yrs. to 1726				1 1	164 to 100
5 Yrs. to 1756	7978	5567	1891	42 to 10	143 to 100

" Epidemics prevailed for fix years, from 1736, to 1741, which checked the increase."

Dakedom of Magdeburgh.

Annual Average.	Births.	Burials.		Proportion of Births to Marriages.	Proportion of Births to Buria's.
5 Yrs. to 1702	6431	4103		38 to 10	156 to 100
5 Yrs. to 1717	7590	- 5335		36 to 10	142 to 100
3 115, 10 1/50	8850	8009	2193	40 to 10	109 to 100

"The years 1738, 1740, 1750, and 1751, were particularly fickly."

For further information on this subject, I refer the reader to Mr. Susmilch's tables. The extracts that I have made are sufficient to shew the periodical, though irregular returns of sickly seafons; and it seems highly probable, that a scantiness of room and food was one of the principal causes that occasioned them.

It appears from the tables, that these countries were increasing rather fast for old states, notwithstanding the occasional sickly seasons that prevailed. Cultivation must have been improving, and marriages, consequently, encouraged. For the checks to population appear to have been rather of the positive, than of the preventive kind. When from a prospect

of increasing plenty in any country, the weight that represses population is in fome degree removed; it is highly probable that the motion will be continued beyond the operation of the cause that first impelled it. Or, to be more particular, when the increasing produce of a country, and the increasing demand for labour, fo far ameliorate the condition of the labourer, as greatly to encourage marriage, it is probable that the custom of early marriages will continue, till the population of the country has gone beyond the increased produce: and fickly feafons appear to be the natural and necessary consequence. I should expect, therefore, that those countries where subfiftence was increasing fufficiently at times to encourage population, but not to answer all its demands, would be more subject to periodical epidemics than those where the

population could more completely accommodate itself to the average produce.

An observation the converse of this will probably also be found true. In those countries that are subject to periodical ficknesses, the increase of population, or the excess of births above the burials, will be greater in the intervals of these periods, than is usual, cæteris paribus, in the countries not fo much subject to such disorders. If Turkey and Egypt have been nearly stationary in their average population for the last century, in the intervals of their periodical plagues, the births must have exceeded the burials in a greater proportion than in fuch countries as France and England.

The average proportion of births to burials in any country for a period of five or ten years, will hence appear to be a very inadequate criterion by which to judge of its real progress in population. This proportion certainly shews the rate of increase during those five or ten years; but we can by no means thence infer, what had been the increase for the twenty years before, or what would be the increase for the twenty years after. Dr. Price observes, that Sweden, Norway, Russia, and the kingdom of Naples, are increasing fast; but the extracts from registers that he has given, are not for periods of fufficient extent to establish the fact. It is highly probable, however, that Sweden, Norway, and Russia, are really increasing in their population, though not at the rate that the proportion of births to burials for the fhort periods that Dr. Price takes would

would feem to fhew *. For five years, ending in 1777, the proportion of births to burials in the kingdom of Naples, was 144 to 100; but there is reason to suppose, that this proportion would indicate an increase much greater than would be really found to have taken place in that kingdom during a period of a hundred years.

Dr. Short compared the registers of many villages and market towns in England for two periods; the first, from Queen Elizabeth to the middle of the last century, and the second, from different years at the end of the last century, to the middle of the present. And from a comparison of these extracts, it appears, that in the former pe-

^{*} See Dr. Price's Observations, 2 Vol. Postscript to the controversy on the population of England and Wales.

riod the births exceeded the burials in the proportion of 124 to 100; but in the latter, only in the proportion of 111 to 100. Dr. Price thinks that the registers in the former period are not to be depended upon; but, probably, in this instance, they do not give incorrect proportions. At least, there are many reasons for expecting to find a greater excess of births above the burials in the former period than in the latter. In the natural progress of the population of any country, more good land will, cæteris paribus *, be taken into cultivation in the earlier stages of it than

^{*} I fay cæteris paribus, because the increase of the produce of any country will always very greatly depend on the spirit of industry that prevails, and the way in which it is directed. The knowledge and habits of the people, and other temporary causes, particularly the degree of civil liberty and equality existing at the time, must always have great influence in exciting and directing this spirit.

in the later. And a greater proportional yearly increase of produce, will almost invariably be followed by a greater proportional increase of population. But, besides this great cause, which would naturally give the excess of births above the burials greater at the end of Queen Elizabeth's reign, than in the middle of the prefent century, I cannot help thinking that the occasional ravages of the plague in the former period, must have had fome tendency to increase this proportion. If an average of ten years had been taken in the intervals of the returns of this dreadful disorder; or if the years of plague had been rejected as accidental, the registers would certainly give the proportion of births to burials too high for the real average increase of the population. For some few years after the great plague in 1666, it is probable that there was a

more than usual excess of births above burials, particularly if Dr. Price's opinion be founded, that England was more populous at the revolution (which happened only 22 years afterwards) than it is at present.

Mr. King, in 1693, stated the proportion of the births to the burials throughout the Kingdom, exclusive of London, as 115 to 100. Dr. Short makes it, in the middle of the prefent century, 111 to 100, including London. The proportion in France for five years, ending in 1774, was 117 to 100. If these statements are near the truth; and if there are no very great variations at particular periods in the proportions, it would appear, that the population of France and England has accommodated itself very nearly to the average produce of each country. The discouragements to marriage, the confequent vicious habits, war, luxury, the filent though certain depopulation of large towns, and the close habitations, and infufficient food of many of the poor, prevent population from increasing beyond the means of subsistence; and, if I may use an expression which certainly at first appears strange, supercede the necessity of great and ravaging epidemics to repress what is redundant. Were a wasting plague to sweep off two millions in England, and fix millions in France, there can be no doubt whatever, that after the inhabitants had recovered from the dreadful flock, the proportion of births to burials would be much above what it is in either country at prefent.

In New Jersey, the proportion of births to deaths on an average of seven years,

years, ending in 1743, was as 300 to 100. In France and England, taking the highest proportion, it is as 117 to 100. Great and aftonishing as this difference is, we ought not to be fo wonderstruck at it, as to attribute it to the miraculous interpolition of heaven. The causes of it are not remote, latent and mysterious; but near us, round about us, and open to the investigation of every inquiring mind. It accords with the most liberal spirit of philosophy, to suppose that not a stone can fall, or a plant rife, without the immediate agency of divine power. But we know from experience, that these operations of what we call nature have been conducted almost invariably according to fixed laws. And fince the world began, the causes of population and depopulation have probably been as constant as any of the laws of nature with which we are acquainted.

The passion between the sexes has appeared in every age to be fo nearly the fame, that it may always be confidered, in algebraic language, as a given quantity. The great law of necessity which prevents population from increafing in any country beyond the food which it can either produce or acquire, is a law, fo open to our view, fo obvious and evident to our understandings. and fo completely confirmed by the experience of every age, that we cannot for a moment doubt it. The different modes which nature takes to prevent, or repress a redundant population, do not appear, indeed, to us fo certain and regular; but, though we cannot always predict the mode, we may with certainty predict the fact. If the proportion

tion of births to deaths for a few years, indicate an increase of numbers much beyond the proportional increased or acquired produce of the country, we may be perfectly certain, that unless an emigration takes place, the deaths will shortly exceed the births; and that the increase that had taken place for a few years cannot be the real average increase of the population of the country. Were there no other depopulating causes, every country would, without doubt, be subject to periodical pestilences or famines.

The only true criterion of a real and permanent increase in the population of any country, is the increase of the means of subsistence. But even this criterion is subject to some slight variations, which are, however, completely open to our view and observations.

tions. In some countries population appears to have been forced; that is, the people have been habituated by degrees to live almost upon the smallest possible quantity of food. There must have been periods in fuch countries when population increased permanently, without an increase in the means of fublishence. China feems to answer to this description. If the accounts we have of it are to be trusted, the lower classes of people are in the habit of living almost upon the smallest possible quantity of food, and are glad to get any putrid offals that European labourers would rather starve than eat. The law in China which permits parents to expose their children, has tended principally thus to force the population. A nation in this state must necessarily be subject to famines. Where a country is fo populous in proportion to the means of fubfishence, that the average produce of it is but barely sufficient to support the lives of the inhabitants, any desiciency from the badness of seafons must be fatal. It is probable that the very srugal manner in which the Gentoos are in the habit of living, contributes in some degree to the famines of Indostan.

In America, where the reward of labour is at prefent fo liberal, the lower classes might retrench very confiderably in a year of scarcity, without materially distressing themselves. A famine therefore scems to be almost impossible. It may be expected, that in the progress of the population of America, the labourers will in time be much less liberally rewarded. The numbers will in this case permanently increase, without a

K 2

proportional increase in the means of fublistence.

In the different States of Europe there must be some variations in the proportion between the number of inhabitants, and the quantity of food confumed, arifing from the different habits of living that prevail in each State. The labourers of the South of England are fo accustomed to eat fine wheaten bread, that they will fuffer themselves to be half flarved, before they will fubmit to live like the Scotch peafants. They might perhaps in time, by the constant operation of the hard law of necessity, be reduced to live even like the lower Chinese: and the country would then, with the fame quantity of food, support a greater population. But to effect this must always be a most difficult, and every

every friend to humanity will hope, an abortive attempt. Nothing is fo common as to hear of encouragements that ought to be given to population. If the tendency of mankind to increase be so great as I have represented it to be, it may appear strange that this increase does not come when it is thus repeatedly called for. The true reason is, that the demand for a greater population is made without preparing the funds necessary to fupport it. Increase the demand for agricultural labour by promoting cultivation, and with it confequently increase the produce of the country, and ameliorate the condition of the labourer, and no apprehensions whatever need beentertained of the proportional increase of population. An attempt to effect this purpose in any other way is vicious, cruel, and tyrannical, and in any ftate of tolerable freedom cannot therefore fucceed. It may appear to be the interest of the rulers, and the rich of a State, to force population, and thereby lower the price of labour, and consequently the expence of sleets and armies, and the cost of manufactures for foreign sale: but every attempt of the kind should be carefully watched and strenuously resisted by the friends of the poor, particularly when it comes under the deceitful garb of benevolence, and is likely, on that account, to be cheerfully, and cordially received by the common people.

I entirely acquit Mr. Pitt of any finister intention in that clause of his poor bill which allows a shilling a week to every labourer for each child he has above three. I consess, that before the bill was brought into Parliament, and for some time after, I thought that such a regulation would be highly beneficial;

but

but further reflection on the subject has convinced me, that if its object be to better the condition of the poor, it is calculated to defeat the very purpofe which it has in view. It has no tendency that I can discover to increase the produce of the country; and if it tend to increase population, without increasing the produce, the necessary and inevitable confequence appears to be, that the fame produce must be divided among a greater number, and confequently that a day's labour will purchase a smaller quantity of provisions, and the poor therefore in general must be more diffressed.

I have mentioned fome cases, where population may permanently increase, without a proportional increase in the means of subsistence. But it is evident that the variation in different States,

1.0252

between the food and the numbers supported by it, is restricted to a limit beyond which it cannot pass. In every country, the population of which is not absolutely decreasing, the food must be necessarily sufficient to support, and to continue, the race of labourers.

Other circumstances being the same, it may be affirmed, that countries are populous, according to the quantity of human food which they produce; and happy, according to the liberality with which that food is divided, or the quantity which a day's labour will purchase. Corn countries are more populous than pasture countries; and rice countries more populous than corn countries. The lands in England are not suited to rice, but they would all bear potatoes: and Dr. Adam Smith observes, that if potatoes were to become the favourite vegeta-

ble food of the common people, and if the fame quantity of land was employed in their culture, as is now employed in the culture of corn, the country would be able to support a much greater population; and would consequently in a very short time have it.

The happiness of a country does not depend, absolutely, upon its poverty, or its riches, upon its youth, or its age, upon its being thinly, or fully inhabited, but upon the rapidity with which it is increasing, upon the degree in which the yearly increase of food approaches to the yearly increase of an unrestricted population. This approximation is always the nearest in new colonies, where the knowledge and industry of an old State, operate on the fertile unappropriated land of a new one. In other cases, the youth or the age of a State is not in this

this respect of very great importance. It is probable, that the food of Great Britain is divided in as great plenty to the inhabitants, at the present period, as it was two thousand, three thousand, or four thousand years ago. And there is reason to believe that the poor and thinly inhabited tracts of the Scotch Highlands, are as much distressed by an overcharged population, as the rich and populous province of Flanders.

Were a country never to be over-run by a people more advanced in arts, but left to its own natural progress in civilization; from the time that its produce might be considered as an unit, to the time that it might be considered as a million, during the lapse of many hundred years, there would not be a single period, when the mass of the people could could be faid to be free from diffres, either directly or indirectly, for want of food. In every State in Europe, fince we have first had accounts of it, millions and millions of human existences have been repressed from this simple cause; though perhaps in some of these States, an absolute samine has never been known.

Famine feems to be the last, the most dreadful resource of nature. The power of population is so superior to the power in the earth to produce subsistence for man, that premature death must in some shape or other visit the human race. The vices of mankind are active and able ministers of depopulation. They are the precursors in the great army of destruction; and often finish the dreadful work themselves. But should they fail in this war of extermination, fickly seasons, epidemics.

demics, pestilence, and plague, advance in terrific array, and sweep off their thousands and ten thousands. Should success be still incomplete; gigantic inevitable famine stalks in the rear, and with one mighty blow, levels the population with the food of the world.

an ablestic fraunt that person been

That the fuperior power of population is repressed, and the actual population kept equal to the means of subsistence by misery and vice.

CHAP. VIII.

Mr. Wallace.—Error of supposing that the difficulty arising from poupulation is at a great distance.—Mr. Condorcet's sketch of the progress of the human mind.—Period when the oscillation, mentioned by Mr. Condorcet, ought to be applied to the human race.

To a person who draws the preceding obvious inferences, from a view of the past and present state of mankind, it cannot but be a matter of aftonishment, that all the writers on the perfectibility of man and of fociety, who have noticed the argument of an overcharged population, treat it always very flightly, and invariably represent the difficulties arising from it, as at a great and almost immeafurable distance. Even Mr. Wallace, who thought the argument itself of fo much weight, as to deftroy his whole fystem of equality, did not feem to be aware that any difficulty

difficulty would occur from this cause. till the whole earth had been cultivated like a garden, and was incapable of any further increase of produce. Were this really the case, and were a beautiful fystem of equality in other respects practicable, I cannot think that our ardour in the purfuit of fuch a scheme ought to be damped by the contemplation of fo remote a difficulty. An event at fuch a distance might fairly be left to providence: but the truth is, that if the view of the argument given in this effay be just, the difficulty fo far from being remote, would be imminent, and immediate. At every period during the progress of cultivation, from the present moment, to the time when the whole earth was become like a garden, the diffrefs for want of food would be constantly pressing on all mankind, if they were equal. Though the produce of the earth

earth might be increasing every year, population would be increasing much faster; and the redundancy must necessarily be repressed by the periodical or constant action of misery or vice.

Mr. Condorcet's Esquisse d'un tableau historique des progrès de l'esprit humain, was written, it is faid, under the preffure of that cruel profcription which terminated in his death. If he had no hopes of its being feen during his life, and of its interesting France in his favour, it is a fingular instance of the attachment of a man to principles, which every days experience was fo fatally for himfelf contradicting. To fee the human mind in one of the most enlightened nations of the world, and after a lapfe of fome thoufand years, debafed by fuch a fermentation of difgusting passions, of fear, cruelty, malice, revenge, ambition, madnefs

nefs, and folly, as would have difgraced the most favage nation in the most barbarous age, must have been such a tremendous shock to his ideas, of the necessary and inevitable progress of the human mind, that nothing but the sirmest conviction of the truth of his principles, in spite of all appearances, could have withfood.

This posthumous publication; is only a sketch of a much larger work, which he proposed should be executed. It necessarily, therefore, wants that detail and application, which can alone prove the truth of any theory. A few observations will be sufficient to shew how completely the theory is contradicted, when it is applied to the real, and not to an imaginary state of things.

In

In the last division of the work, which treats of the future progress of man towards perfection, he fays, that comparing, in the different civilized nations of Enrope, the actual population with the extent of territory; and observing their cultivation, their industry, their divisions of labour, and their means of fubfistence. we shall fee that it would be impossible to preferve the fame means of fubfiftence, and, confequently, the fame population, without a number of individuals, who have no other means of fupplying their wants, than their industry. Having allowed the necessity of such a class of men, and adverting afterwards to the precarious revenue of those families that would depend fo entirely on the life and health of their chief*, he fays, very justly, " There

[&]quot;To fave time and long quotations, I shall here give the substance of some of Mr. Condorcet's sentiments,

"There exists then, a necessary cause of inequality, of dependence, and even of mifery, which menaces, without ceafing, the most numerous and active class of our focieties." The difficulty is just, and well stated, and I am afraid that the mode by which he propofes it should be removed, will be found inefficacious. By the application of calculations to the probabilities of life, and the interest of money, he proposes that a fund should be established, which should assure to the old an assistance, produced, in part, by their own former favings, and, in part, by the favings of individuals, who in making the fame facrifice, die before they reap the benefit of it. The fame, or a fimilar fund, should give assistance to

timents, and hope I shall not misrepresent them, but I refer the reader to the work itself, which will amuse, if it does not convince him. women and children, who lofe their hufbands, or fathers; and afford a capital to those who were of an age to found a new family, fufficient for the proper development of their industry. These establishments he observes, might be made, in the name, and under the protection, of the fociety. Going still further, he fays, that by the just application of calculations, means might be found of more completely preferving a flate of equality, by preventing credit from being the exclusive privilege of great fortunes, and yet giving it a basis equally solid, and by rendering the progrefs of industry, and the activity of commerce, less dependent on great capitalists.

Such eftablishments and calculations, may appear very promising upon paper, but when applied to real life, they will be found to be absolutely nugatory. Mr.

Condorcet

Condorcet allows, that a class of people, which maintains itself entirely by industry, is necessary to every state. Why does he allows this? No other reason can well be assigned, than that he conceives that the labour necessary to procure subfiftence for an extended population, will not be performed without the goad of necessity. If by establishments of this kind, this four to industry be removed. if the idle and the negligent are placed upon the fame footing with regard to their credit, and the future support of their wives and families, as the active and industrious; can we expect to see men exert that animated activity in bettering their condition, which now forms the master spring of public profperity. If an inquisition were to be established, to examine the claims of each individual, and to determine whether he had, or had not, exerted himself to the

L 3

utmost

utmost, and to grant or refuse assistance accordingly, this would be little else than a repetition upon a larger scale of the English poor laws, and would be completely destructive of the true principles of liberty and equality.

But independent of this great objection to these establishments, and supposing for a moment, that they would give no check to productive industry, by far the greatest difficulty remains yet behind.

Were every man fure of a comfortable provision for a family, almost every man would have one; and were the rising generation free from the "killing frost" of misery, population must rapidly increase. Of this, Mr. Condorcet seems to be fully aware himself; and after having described further improvements, he says,

"But in this progress of industry and happiness, each generation will be called to more extended enjoyments, and in confequence, by the physical constitution of the human frame, to an increase in the number of individuals. Must not there arrive a period then, when thefe laws, equally necessary, shall counteract each other? When the increase of the number of men furpassing their means of fubfiftence, the necessary refult must be, either a continual diminution of happiness and population, a movement truly retrograde, or at least, a kind of ofcillation between good and evil? In focieties arrived at this term, will not this ofcillation be a constantly subfisting cause of periodical misery? Will it not mark the limit when all further amelioration will become impossible, and point out that term to the perfectibility of the human race, which it may reach in the course of ages, but can never pass?

He then adds,

"There is no person who does not see how very distant such a period is from us; but shall we ever arrive at it? It is equally impossible to pronounce for or against the future realization of an event, which cannot take place, but at an æra, when the human race will have attained improvements, of which we can at present scarcely form a conception."

Mr. Condorcet's picture of what may be expected to happen when the number of men shall surpass the means of their subsistence, is justly drawn. The oscillation which he describes, will certainly take place, and will, without doubt, be a constantly subsisting cause of periodical misery. The only point in which I differ from Mr. Condorcet with regard

to this picture, is, the period, when it may be applied to the human race. Mr. Condorcet thinks, that it cannot possibly be applicable, but at an æra extremely distant. If the proportion between the natural increase of populalation and food, which I have given, be in any degree near the truth, it will appear, on the contrary, that the period when the number of men furpass their means of subsistence, has long fince arrived; and that this necessary oscillation, this constantly subfissing cause of periodical mifery, has existed ever fince we have had any histories of mankind, does exist at present, and will for ever continue to exist, unless some decided change take place, in the phyfical constitution of our nature.

Mr. Condorcet, however, goes on to fay, that should the period, which he conceives

conceives to be fo distant, ever arrive. the human race, and the advocates for the perfectibility of man, need not be alarmed at it. He then proceeds to remove the difficulty in a manner, which I profess not to understand. Having obferved, that the ridiculous prejudices of fuperstition, would by that time have ceased to throw over morals, a corrupt and degrading aufterity, he alludes, either to a promifcuous concubinage, which would prevent breeding, or to fomething elfc as unnatural. To remove the difficulty in this way, will, furely, in the opinion of most men, be, to destroy that virtue, and purity of manners, which the advocates of equality, and of the perfectibility of man, profess to be the end and object of their views.

CHAP. IX.

Mr. Condorcet's conjecture concerning the organic perfectibility of man, and the indefinite prolongation of human life.—Fallacy of the argument, which infers an unlimited progress from a partial improvement, the limit of which cannot be ascertained, illustrated in the breeding of animals, and the cultivation of plants.

THE last question which Mr. Condorcet proposes for examination, is, the organic perfectibility of man. He observes, that if the proofs which have been already given, and which, in their development will receive greater force in the work itself, are sufficient to establish the indefinite perfectibility of man, upon the supposition, of the same natural faculties, and the same organization which he has at present; what will be the certainty, what the extent of our hope, if this organization, these natural faculties them-

themselves, are susceptible of ameliora-

From the improvement of medicine; from the use of more wholesome food, and habitations; from a manner of living, which will improve the strength of the body by exercife, without impairing it by excess; from the destruction of the two great causes of the degradation of man, mifery, and too great riches; from the gradual removal of transmissible and contagious diforders, by the improvement of phyfical knowledge, rendered more efficacious, by the progress of reason and of focial order; he infers, that though man will not abfolutely become immortal, yet that the duration between his birth, and natural death, will increase without ceasing, will have no assignable term, and may properly be expressed by the word indefinite. He then defines

this word to mean, either a conftant approach to an unlimited extent, without ever reaching it; or, an increase in the immensity of ages to an extent greater than any assignable quantity.

But furely the application of this term in either of these senses, to the duration of human life, is in the highest degree unphilosophical, and totally unwarranted by any appearances in the laws of nature. Variations from different causes are effentially diffinct from a regular and unretrograde increase. The average duration of human life will, to a certain degree, vary, from healthy or unhealthy climates; from wholesome or unwholesome food. from virtuous or vicious manners, and other causes; but it may be fairly doubted, whether there is really the smallest perceptible advance in the natural duration of human life, fince first we have had

any authentic history of man. The prejudices of all ages have indeed been directly contrary to this supposition, and though I would not lay much stress upon these prejudices, they will in some measure tend to prove, that there has been no marked advance in an opposite direction.

It may perhaps be faid, that the world is yet fo young, so completely in its infancy, that it ought not to be expected that any difference should appear so soon.

If this be the case, there is at once an end of all human science. The whole train of reasonings from effects to causes will be destroyed. We may shut our eyes to the book of nature, as it will no longer be of any use to read it. The wildest and most improbable conjectures may be advanced with as much certainty

as the most just and sublime theories. founded on careful and reiterated experiments. We may return again to the old mode of philosophizing, and make facts bend to fystems, instead of establishing fystems upon facts. The grand and confiftent theory of Newton, will be placed upon the fame footing as the wild and excentric hypotheses of Descartes. In fhort, if the laws of nature are thus fickle and inconstant; if it can be affirmed, and be believed, that they will change, when for ages and ages they have appeared immutable, the human mind will no longer have any incitements to inquiry, but must remain sixed in inactive torpor, or amufe itself only in bewildering dreams, and extravagant fancies.

The constancy of the laws of nature, and of effects and causes, is the foundation of all human knowledge; though

far be it from me to fay, that the fame power which framed and executes the laws of nature, may not change them all " in a moment, in the twinkling of an eye." Such a change may undoubtedly happen. All that I mean to fay is, that it is impossible to infer it from reafoning. If without any previous observable fymptoms or indications of a change, we can infer that a change will take place, we may as well make any affertion whatever, and think it as unreasonable to be contradicted, in affirming that the moon will come in contact with the earth to-morrow, as in faying, that the fun will rife at its-ufual time.

With regard to the duration of human life, there does not appear to have existed, from the earliest ages of the world, to the present moment, the smallest permanent symptom, or indication, of increasing

creafing prolongation.* The observable effects of climate, habit, diet, and other causes,

* Many, I doubt not, will think that the attempting gravely to controvert so absurd a paradox, as the immortality of man on earth, or indeed, even the perfectibility of man and fociety, is a waste of time and words; and that such unfounded conjectures are best answered by neglect. I profess, however, to be of a different opinion. When paradoxes of this kind are advanced by ingenious and able men, neglect has no tendency to convince them of their mistakes. Priding themselves on what they conceive to be a mark of the reach and fize of their own understandings, of the extent and comprehensiveness of their views; they will look upon this neglect merely as an indication of poverty, and narrowness, in the mental exertions of their contemporaries; and only think, that the world is not yet prepared to receive their fublime truths.

On the contrary, a candid investigation of these subjects, accompanied with a perfect readiness to adopt any theory, warranted by sound philosophy, may have a tendency to convince them, that in forming improbable and unsounded hypotheses, so far from M enlarging

causes, on length of life, have furnished the pretext for afferting its indefinite extension; and the fandy foundation on

enlarging the bounds of human science, they are contracting it; so far from promoting the improvement of the human mind, they are obstructing it: they are throwing us back again almost into the infancy of knowledge; and weakening the foundations of that mode of philosophifing, under the auspices of which, science has of late made such rapid advances. The present rage for wide and unrestrained speculation, feems to be a kind of mental intoxication, arifing, perhaps, from the great and unexpected discoveries which have been made of late years, in various branches of science. To men elate, and giddy with such successes, every thing appeared to be within the grasp of human powers; and, under this illusion, they confounded subjects where no real progress could be proved, with those, where the progress had been marked, certain, and acknowledged. Could they be perfuaded to fober themselves with a little severe and chastized thinking, they would see, that the cause of truth, and of found philosophy, cannot but fuffer by substituting wild slights and unsupported affertions, for patient investigation, and well authenticated proofs.

which the argument rests, is, that because the limit of human life is undefined; because you cannot mark its precife term, and fay fo far exactly shall it go and no further; that therefore its extent may increase for ever, and be properly termed, indefinite or unlimited. But the fallacy and abfurdity of this argument will fufficiently appear from a flight examination of what Mr. Condorcet calls the organic perfectibility, or degeneration, of the race of plants and animals, which he fays may be regarded as one of the general laws of nature.

I am told that it is a maxim among the improvers of cattle, that you may breed to any degree of nicety you pleafe, and they found this maxim upon another, which is, that some of the offspring will possess the desirable qualities of the parents in a greater degree. In the famous Leicestershire breed of sheep, the object is to procure them with small heads and fmall legs. Proceeding upon thefe breeding maxims, it is evident, that we might go on till the heads and legs were evanescent quantities; but this is fo palpable an abfurdity, that we may be quite fure that the premifes are not just, and that there really is a limit, though we cannot fee it, or fay exactly where it is. In this case, the point of the greatest degree of improvement, or the fmallest fize of the head and legs, may be faid to be undefined, but this is very different from unlimited, or from indefininite, in Mr. Condorcet's acceptation of the term. Though I may not be able, in the prefent inflance, to mark the limit, at which further improvement will stop, I can very easily mention a point at which it will not arrive. I should not scruple to affert, that were the breeding

to continue for ever, the head and legs of these sheep would never be so small as the head and legs of a rat.

It cannot be true, therefore, that among animals, fome of the offspring will poffess the desirable qualities of the parents in a greater degree; or that animals are indefinitely perfectible.

The progress of a wild plant, to a beautiful garden flower, is perhaps more marked and striking, than any thing that takes place among animals, yet even here, it would be the height of absurdity to affert, that the progress was unlimited or indefinite. One of the most obvious features of the improvement is the increase of size. The flower has grown gradually larger by cultivation. If the progress were really unlimited, it might be increased ad infinitum; but

this is fo grofs an abfurdity, that we may be quite fure, that among plants, as well as among animals, there is a limit to improvement, though we do not exactly know where it is. It is probable that the gardeners who contend for flower prizes have often applied ftronger drefsing without fuccess. At the same time. it would be highly prefumptuous in any man to fay, that he had feen the finest carnation or anemone that could ever be made to grow. He might however affert without the fmallest chance of being contradicted by a future fact, that no carnation or anemone could ever by cultivation be increased to the fize of a large cabbage; and yet there are assignable quantities much greater than a cabbage. No man can fay that he has feen the largest ear of wheat, or the largest oak that could ever grow; but he might easily, and with perfect certainty, name a point

point of magnitude, at which they would not arrive. In all these cases therefore, a careful distinction should be made, between an unlimited progress, and a progress where the limit is merely undefined.

4

It will be faid, perhaps, that the reafon why plants and animals cannot increase indefinitely in fize, is, that they
would fall by their own weight. I answer, how do we know this but from
experience? from experience of the degree of strength with which these bodies
are formed. I know that a carnation,
long before it reached the size of a cabbage, would not be supported by its
stalk; but I only know this from my
experience of the weakness, and want of
tenacity in the materials of a carnation
stalk. There are many substances in na-

ture of the fame fize that would support as large a head as a cabbage.

The reasons of the mortality of plants are at present persectly unknown to us. No man can say why such a plant is annual, another biennial, and another endures for ages. The whole affair in all these cases, in plants, animals, and in the human race, is an affair of experience; and I only conclude that man is mortal, because the invariable experience of all ages has proved the mortality of those materials of which his visible body is made.

What can we reason but from what we know."

Sound philosophy will not authorize me to alter this opinion of the mortality of man on earth, till it can be clearly proved, that the human race has made,

made, and is making, a decided progress towards an illimitable extent of life. And the chief reason why I adduced the two particular instances from animals and plants, was to expose, and illustrate, if I could, the fallacy of that argument, which infers an unlimited progress, merely because some partial improvement has taken place, and that the limit of this improvement cannot be precisely ascertained.

The capacity of improvement in plants and animals, to a certain degree, no perfon can possibly doubt. A clear and decided progress has already been made; and yet, I think it appears, that it would be highly abfurd to fay, that this progress has no limits. In human life, though there are great variations from different causes, it may be doubted, whether, since the world began, any organic

organic improvement whatever in the human frame can be clearly afcertained. The foundations therefore, on which the arguments for the organic perfectibility of man rest, are unusually weak, and can only be confidered as mere conjectures. It does not, however, by any means, feem impossible, that by an attention to breed, a certain degree of improvement, fimilar to that among animals, might take place among men, Whether intellect could be communicated may be a matter of doubt: but fize, ftrength, beauty, complexion, and perhaps even longevity are in a degree tranfmissible. The error does not seem to lie, in fuppofing a fmall degree of improvement possible, but in not discriminating between a finall improvement, the limit of which is undefined, and an improvement really unlimited. As the human race however could not be improved in

this way, without condemning all the bad specimens to celibacy, it is not probable, that an attention to breed-should ever become general; indeed, I know of no well-directed attempts of the kind, except in the ancient family of the Bickerstaffs, who are faid to have been very successful in whitening the skins, and increasing the height of their race by prudent marriages, particularly by that very judicious cross with Maud, the milk-maid, by which some capital defects in the constitutions of the family were corrected.

It will not be necessary, I think, in order more completely to shew the improbability of any approach in man towards immortality on earth, to urge the very great additional weight that an increase in the duration of life would give to the argument of population.

Mr. Condorcet's book may be confidered, not only as a sketch of the opinions of a celebrated individual, but of many of the literary men in France, at the beginning of the revolution. As such, though merely a sketch, it seems worthy of attention.

CHAP. X.

Mr. Godwin's system of equality.—Error of attributing all the vices of mankind to human institutions.—Mr. Godwin's sirst answer to the difficulty arising from population totally insufficient.—Mr. Godwin's beautiful system of equality supposed to be realized.—It's utter destruction simply from the principle of population in so short a time as thirty years.

In reading Mr. Godwin's ingenious and able work on political justice, it is impossible not to be struck with the spirit and energy of his style, the force and precision of some of his reasonings, the ardent tone of his thoughts, and particularly with that impressive earnest-ness of manner which gives an air of truth to the whole. At the same time, it must be confessed, that he has not proceeded in his enquiries with the caution that sound philosophy seems to require. His conclusions are often un-

warranted by his premifes. He fails fometimes in removing the objections which he himself brings forward. He relies too much on general and abstract propositions which will not admit of application. And his conjectures certainly far outstrip the modesty of nature.

The fystem of equality which Mr. Godwin proposes, is, without doubt, by far the most beautiful and engaging of any that has yet appeared. An amelioration of fociety to be produced merely by reason and conviction, wears much more the promife of permanence, than any change effected and maintained by force. The unlimited exercise of private judgment, is a doctrine inexpressibly grand and captivating, and has a vast fuperiority over those systems where every individual is in a manner the flave of the public. The substitution of benevolence

volence as the master-spring, and moving principle of fociety, instead of felflove, is a confummation devoutly to be wished. In short, it is impossible to contemplate the whole of this fair structure, without emotions of delight and admiration, accompanied with ardent longing for the period of its accomplishment. But, alas! that moment can never arrive. The whole is little better than a dream, a beautiful phantom of the imagination. These "gorgeous palaces" of happiness and immortality, these "folemn temples" of truth and virtue will diffolye, "like the baseless fabric of a vision," when we awaken to real life, and contemplate the true and genuine fituation of man on earth.

Mr. Godwin, at the conclusion of the third chapter of his eighth book, speaking of population, says, "There is a prin-

principle in human fociety, by which population is perpetually kept down to the level of the means of fubfiftence. Thus among the wandering tribes of America and Afia, we never find through the lapfe of ages that population has fo increased as to render necessary the cultivation of the earth" This principle, which Mr. Godwin thus mentions as some mysterious and occust cause, and which he does not attempt to investigate, will be found to be the grinding law of necessity; misery, and the sear of misery.

The great error under which Mr. Godwin labours throughout his whole work, is, the attributing almost all the vices and misery that are seen in civil society to human institutions. Political regulations, and the established administration of property, are with him

the

the fruitful fources of all evil, the hotbeds of all the crimes that degrade mankind. Were this really a true state of the case, it would not seem a hopeless task to remove evil completely from the world; and reason seems to be the proper and adequate instrument for effecting fo great a purpose. But the truth is, that though human institutions appear to be the obvious and obtrusive causes of much mischief to mankind; yet, in reality, they are light and fuperficial, they are mere feathers that float on the furface, in comparison with those deeper seated causes of impurity that corrupt the fprings, and render turbid the whole stream of human life.

Mr. Godwin, in his chapter on the benefits attendant on a fystem of equality, says, "The spirit of oppression, the spirit of servility, and the spirit of N fraud,

fraud, thefe are the immediate growth of the established administration of property. They are alike hostile to intellectual improvement. The other vices of envy, malice, and revenge, are their inseparable companions. In a state of fociety, where men lived in the midst of plenty, and where all fhared alike the bounties of nature, these sentiments would inevitably expire. The narrow principle of felfishness would vanish. No man being obliged to guard his little ftore, or provide with anxiety and pain for his reftless wants, each would lose his individual existence in the thought of the general good. No man would be an enemy to his neighbour, for they would have no fubject of contention; and, of confequence, philanthropy would refume the empire which reason assigns her. Mind would be delivered from her perpetual anxiety about corporal fupport,

fupport, and free to expatiate in the field of thought, which is congenial to her. Each would assist the enquiries of all."

This would, indeed, be a happy state. But that it is merely an imaginary picture, with scarcely a feature near the truth, the reader, I am asraid, is already too well convinced.

Man cannot live in the midst of plenty. All cannot share alike the bounties of nature. Were there no established administration of property, every man would be obliged to guard with force his little store. Selfishness would be triumphant. The subjects of contention would be perpetual. Every individual mind would be under a constant anxiety about corporal support; and not

N 2 a fingle

a fingle intellect would be left free to expatiate in the field of thought.

How little Mr. Godwin has turned the attention of his penetrating mind to the real state of man on earth, will fufficiently appear from the manner in which he endeavours to remove the difficulty of an overcharged population. He fays, "The obvious answer to this objection, is, that to reason thus is to foresee difficulties at a great distance. Three fourths of the habitable globe is now uncultivated. The parts already cultivated are capable of immeasureable improvement. Myriads of centuries of still increasing population may pass away, and the earth be still found sufficient for the fubfistence of its inhabitants."

I have already pointed out the error of supposing that no distress and difficulty

culty would arise from an overcharged population before the earth absolutely refused to produce any more. But let us imagine for a moment Mr. Godwin's beautiful system of equality realized in its utmost purity, and see how soon this difficulty might be expected to press under so perfect a form of society. A theory that will not admit of application cannot possibly be just.

Let us suppose all the causes of mifery and vice in this island removed. War and contention cease. Unwholesome trades and manufactories do not exist. Crowds no longer collect together in great and pestilent cities for purposes of court intrigue, of commerce, and vicious gratifications. Simple, healthy, and rational amusements take place of drinking, gaming and debauchery. There are no towns sufficiently large to have

any prejudicial effects on the human constitution. The greater part of the happy inhabitants of this terrestrial paradife live in hamlets and farm-houses fcattered over the face of the country. Every house is clean, airy, sufficiently roomy, and in a healthy fituation. All men are equal. The labours of luxury are at end. And the necessary labours of agriculture are shared amicably among all. The number of persons, and the produce of the island, we suppose to be the same as at present. The spirit of benevolence, guided by impartial justice, will divide this produce among alle the members of the fociety according to their wants. Though it would be impossible that they should all have animal food every day, yet vegetable food, with meat occasionally, would fatisfy the defires of a frugal people, and would be fufficient to preferve

ferve them in health, ftrength, and spirits.

OND YEST THE

Mr. Godwin confiders marriage as a fraud and a monopoly. Let us suppose the commerce of the fexes established upon principles of the most perfect freedom. Mr. Godwin does not think himfelf that this freedom would lead to a promiscuous intercourfe; and in this I perfectly agree with him. The love of variety is a vicious, corrupt, and unnatural tafte, and could not prevail in any great degree in a fimple and virtuous state of fociety. Each man would probably felect himfelf a partner, to whom he would adhere as long as that adherence continued to be the choice of both parties. It would be of little confequence, according to Mr. Godwin, how many children a woman had, or to whom they belonged. Provifions and assistance would spontaneously flow from the quarter in which they abounded, to the quarter that was deficient*. And every man would be ready to furnish instruction to the rising generation according to his capacity.

I cannot conceive a form of fociety fo favourable upon the whole to population. The irremediableness of marriage, as it is at present constituted, undoubtedly deters many from entering into that state. An unshackled intercourse on the contrary, would be a most powerful incitement to early attachments: and as we are supposing no anxiety about the future support of children to exist, I do not conceive that there would be one woman in a hundred, of twenty three, without a family.

* See B. 8. Chap. 8. P. 504.

With these extraordinary encouragements to population, and every cause of depopulation, as we have supposed, removed, the numbers would necessarily increase faster than in any society that has ever yet been known. I have mentioned, on the authority of a pamphlet published by a Dr. Styles, and referred to by Dr. Price, that the inhabitants of the back fettlements of America doubled their numbers in fifteen years. England is certainly a more healthy country than the back fettlements of America; and as we have supposed every house in the island to be airy and wholesome, and the encouragements to have a family greater even than with the back fettlers, no probable reason can be assigned, why the population should not double itself in less, if possible, than fifteen years. But to be quite fure that we do not go beyond the truth, we will only suppose the period of doubling to be twenty-five years, a ratio of increase, which is well known to have taken place throughout all the Northern States of America.

There can be little doubt, that the equalization of property which we have supposed, added to the circumstance of the labour of the whole community being directed chiefly to agriculture, would tend greatly to augment the produce of the country. But to answer the demands of a population increasing so rapidly, Mr. Godwin's calculation of half an hour a day for each man, would certainly not be fufficient. It is probable that the half of every man's time must be employed for this purpose. Yet with fuch, or much greater exertions, a perfon who is acquainted with the nature of the foil in this country, and who reflects on the fertility of the lands already in culticultivation, and the barreness of those that are not cultivated, will be very much disposed to doubt, whether the whole average produce could possibly be doubled in twenty-five years from the present period. The only chance of fuccess would be the ploughing up all the grazing countries, and putting an end almost entirely to the use of animal food. Yet a part of this scheme might defeat itself. The soil of England will not produce much without drefsing; and cattle feem to be neceffary to make that species of manure, which best suits the land. In China. it is faid, that the foil in some of the provinces is fo fertile, as to produce two crops of rice in the year without drefsing. None of the lands in England will answer to this description.

Difficult, however, as it might be, to double the average produce of the island in twenty-

twenty-five years, let us suppose it effected. At the expiration of the first period therefore, the food, though almost entirely vegetable, would be sufficient to support in health, the doubled population of fourteen millions.

During the next period of doubling, where will the food be found to fatisfy the importunate demands of the increasing numbers. Where is the fresh land to turn up? where is the drefsing neceffary to improve that which is already in cultivation? There is no person with the smallest knowledge of land, but would fay, that it was impossible that the average produce of the country could be increased during the second twenty-five years by a quantity equal to what it at prefent yields. Yet we will suppose this increase, however improbable, to take place. The exuberant strength ftrength of the argument allows of almost any concession. Even with this concession, however, there would be seven millions at the expiration of the second term, unprovided for. A quantity of sood equal to the frugal support of twenty-one millions, would be to be divided among twenty-eight millions.

Alas! what becomes of the picture where men lived in the midst of plenty: where no man was obliged to provide with anxiety and pain for his restless wants: where the narrow principle of selsishness did not exist: where Mind was delivered from her perpetual anxiety about corporal support, and free to expatiate in the sield of thought which is congenial to her. This beautiful sabric of imagination vanishes at the severe touch of truth. The spirit of benevolence, cherished and invigorated by plenty, is repressed

repressed by the chilling breath of want. The hateful passions that had vanished. reappear. The mighty law of felf-prefervation, expels all the fofter and more exalted emotions of the foul. The temptations to evil are too strong for human nature to refift. The corn is plucked before it is ripe, or fecreted in unfair proportions; and the whole black train of vices that belong to falfehood are immediately generated. Provisions no longer flow in for the support of the mother with a large family. The children are fickly from infufficient food. The rofy flush of health gives place to the pallid cheek and hollow eye of mifery. Benevolence yet lingering in a few bosoms, makes some faint expiring struggles, till at length felf-love refumes his wonted empire, and lords it triumphant over the world.

No human inftitutions here existed, to the perverseness of which Mr. Godwin afcribes the original fin of the worst men*. No opposition had been produced by them between public and private good. No monopoly had been created of those advantages which reason directs to be left in common. No man had been goaded to the breach of order by unjust laws. Benevolence had established her reign in all hearts: and yet in fo short a period as within fifty years, violence, oppression, falsehood, misery, every hateful vice, and every form of diffrefs, which degrade and fadden the prefent state of fociety, feem to have been generated by the most imperious circumstances, by laws inherent in the nature of man, and absolutely independent of all human regulations.

^{*} B. 8. C. 3. P. 340.

If we are not yet too well convinced of the reality of this melancholy picture, let us but look for a moment into the next period of twenty-five years: and we shall see twenty-eight millions of human beings without the means of fupport; and before the conclusion of the first century, the population would be one hundred and twelve millions, and the food only fufficient for thirty-five millions, leaving feventy-feven millions unprovided for. In these ages want would be indeed triumphant, and rapine and murder must reign at large: and yet all this time we are supposing the produce of the earth absolutely unlimited, and the yearly increase greater than the boldest speculator can imagine.

This is undoubtedly a very different view of the difficulty arising from population,

pulation, from that which Mr. Godwin gives, when he fays, "Myriads of centurics of still increasing population may pass away, and the earth be still found fufficient for the sublistence of its inhabitants."

I am fufficiently aware that the redundant twenty-eight millions, or feventy-feven millions, that I have mentioned, could never have existed. It is a perfectly just observation of Mr. Godwin, that, "There is a principle in human fociety, by which population is perpetually kept down to the level of the means of fubfistence." The fole queftion is, what is this principle? Is it fome obscure and occult cause? Is it fome mysterious interference of heaven, which at a certain period, strikes the men with impotence, and the women with barrenness? Or is it a cause, open to

our refearches, within our view, a cause, which has constantly been observed to operate, though with varied force, in every state in which man has been placed? Is it not a degree of misery, the necessary and inevitable result of the laws of nature, which human institutions, so far from aggravating, have tended considerably to mitigate, though they never can remove.

It may be curious to observe, in the case that we have been supposing, how some of the laws which at present govern civilized society, would be successively dictated by the most imperious necessity. As man, according to Mr. Godwin, is the creature of the impressions to which he is subject, the goadings of want could not continue long, before some violations of public or private stock would necessarily take place. As these violations increased

increased in number and extent, the more active and comprehensive intellects of the fociety would foon perceive, that while population was fast increasing, the yearly produce of the country would thortly begin to diminish. The urgency of the case would suggest the necessity of fome immediate measures to be taken for the general fafety. Some kind of convention would then be called, and the dangerous fituation of the country ftated in the ftrongest terms. It would be observed, that while they lived in the midst of plenty, it was of little confequence who laboured the leaft, or who poffeffed the leaft, as every man was perfectly willing and ready to fupply the wants of his neighbour. But that the question was no longer, whether one man should give to another, that which he did not use himself; but whether he should give to his neighbour the food which was absolutely neceffary to his own existence. It would be represented, that the number of those that were in want very greatly exceeded the number and means of those who should Impply them: that thefe pressing wants, which from the state of the produce of the country could not all be gratified, had occasioned some flagrant violations of justice: that these violations had already checked the increase of food, and would, if they were not by fome means or other prevented, throw the whole community in confusion: that imperious necessity feemed to dictate that a yearly increase of produce should, if possible, be obtained at all events: that in order to effect this first, great, and indispensible purpose, it would be adviseable to make a more complete division of land, and to fecure every man's flock against violation

lation by the most powerful fanctions, even by death itself.

It might be urged perhaps by fome objectors, that, as the fertility of the land increased, and various accidents occurred, the share of some men might be much more than fufficient for their fupport, and that when the reign of felf-love was once established, they would not distribute their furplus produce without fome compenfation in return. It would be obferved, in answer, that this was an inconvenience greatly to be lamented; but that it was an evil which bore no comparison to the black train of distresses, that would inevitably be occasioned by the infecurity of property: that the quantity of food which one man could confume, was necessarily limited by the narrow capacity of the human stomach: that it was not certainly probable that he should throw away the rest; but that even if he exchanged his surplus sood for the labour of others, and made them in some degree dependent on him, this would still be better than that these others should absolutely starve.

It feems highly probable, therefore, that an administration of property, not very different from that which prevails in civilized States at prefent, would be established, as the best, though inadequate, remedy, for the evils which were pressing on the society.

The next fubject that would come under discussion, intimately connected with the preceding, is, the commerce between the sexes. It would be urged by those who had turned their attention to the true cause of the difficulties under which the community laboured, that while

while every man felt fecure that all his children would be well provided for by general benevolence, the powers of the earth would be absolutely inadequate to produce food for the population which would inevitably enfue: that even, if the whole attention and labour of the fociety were directed to this fole point, and if, by the most perfect fecurity of property, and every other encouragement that could be thought of, the greatest possible increase of produce were yearly obtained; yet still, that the increase of food would by no means keep pace with the much more rapid increase of population: that fome check to population therefore was imperioufly called for: that the most natural and obvious check feemed to be, to make every man rovide for his own children: that this rould operate in some respect, as a meaare and guide, in the increase of population; as it might be expected that no man would bring beings into the world, for whom he could not find the means of fupport: that where this notwithstanding was the case, it seemed necessary, for the example of others, that the disgrace and inconvenience attending such a conduct, should fall upon that individual, who had thus inconsiderately plunged himfelf and innocent children in misery and want.

The inftitution of marriage, or at leaft, of some express or implied obligation on every man to support his own children, seems to be the natural result of these reasonings in a community under the difficulties that we have supposed.

The view of these difficulties, presents us with a very natural origin of the superior disgrace which attends a breach

of chastity in the woman, than in the man. It could not be expected that women should have resources sufficient to support their own children. When therefore a woman was connected with a man, who had entered into no compact to maintain her children; and aware of the inconveniences that he might bring upon himfelf, had deferted her, thefe children must necessarily fall for support upon the fociety, or starve. And to prevent the frequent recurrence of fuch an inconvenience, as it would be highly unjust to punish so natural a fault by personal restraint or infliction, the men might agree to punish it with disgrace. The offence is befides more obvious and conspicuous in the woman, and less liable to any mistake. The father of a child may not always be known, but the fame uncertainty cannot eafily exist with regard to the mother. Where, the evi-

dence

dence of the offence was most complete, and the inconvenience to the society at the same time the greatest, there, it was agreed, that the largest share of blame should fall. The obligation on every man to maintain his children, the society would ensorce, if there were occasion; and the greater degree of inconvenience or labour, to which a samily would necessarily subject him, added to some portion of disgrace which every human being must incur, who leads another into unhappiness, might be considered as a sufficient punishment for the man.

That a woman should at present be almost driven from society, for an offence, which men commit nearly with impunity, seems to be undoubtedly a breach of natural justice. But the origin of the custom, as the most obvious and effectual method of preventing the frequent

recurrence of a ferious inconvenience to a community, appears to be natural, though not perhaps perfectly justifiable. This origin, however, is now lost in the new train of ideas which the custom has since generated. What at first might be dictated by state necessity, is now supported by semale delicacy; and operates with the greatest force on that part of society, where, if the original intention of the custom were preserved, there is the least real occasion for it.

When these two fundamental laws of society, the security of property, and the institution of marriage, were once established, inequality of conditions must necessarily follow. Those who were born after the division of property, would come into a world already possessed. If their parents, from having too large a family, could not give them sufficient for

their fupport, what are they to do in a world where every thing is appropriated? We have feen the fatal effects that would refult to a fociety, if every man had a valid claim to an equal fhare of the produce of the earth. The members of a family which was grown too large for the original division of land appropriated to it, could not then demand a part of the furplus produce of others, as a debt of justice. It has appeared, that from the inevitable laws of our nature, some human beings must fuffer from want. Thefe are the unhappy perfons who, in the great lottery of life, have drawn a blank. The number of these claimants would foon exceed the ability of the furplus produce to fupply. Moral merit is a very difficult diffinguishing criterion, except in extreme cases. The owners of furplus produce would in general feek fome more obvious mark of distinction.

And it feems both natural and just, that except upon particular occasions, their choice should fall upon those, who were able, and professed themselves willing, to exert their strength in procuring a further furplus produce; and thus at once benefiting the community, and enabling these proprietors to afford assistance to greater numbers. All who were in want of food would be urged by imperious necessity to offer their labour in exchange for this article fo absolutely essential to existence. The fund appropriated to the maintenance of labour, would be, the aggregate quantity of food possessed by the owners of land beyond their own confumption. When the demands upon this fund were great and numerous, it would naturally be divided in very small shares. Labour would be ill paid. Men would offer to work for a bare sublistence, and the rearing of families would be checkchecked by fickness and misery. On the contrary, when this fund was increasing fast; when it was great in proportion to the number of claimants; it would be divided in much larger shares. No man would exchange his labour without receiving an ample quantity of food in return. Labourers would live in ease and comfort; and would consequently be able to tear a numerous and vigorous off-fpring.

On the state of this fund, the happiness, or the degree of misery, prevailing among the lower classes of people in every known State, at present chiefly depends. And on this happiness, or degree of misery, depends the increase. Stationariness, or decrease of population.

And thus it appears, that a fociety confittuted according to the most beautiful form that imagination can conceive, with benevolence for its moving principle, instead of felf-love, and with every evil disposition in all its members corrected by reason and not force, would, from the inevitable laws of nature, and not from any original depravity of man, in a very fhort period, degenerate into a fociety, constructed upon a plan not essentially different from that which prevails in every known State at prefent; I mean, a fociety divided into a class of proprietors, and a class of labourers, and with felf-love for the main-fpring of the great machine.

In the supposition I have made, I have undoubtedly taken the increase of population smaller, and the increase of produce greater, than they really would be. No reason can be assigned, why, under the circumstances I have supposed,

3

population should not increase faster than in any known instance. If then we were to take the period of doubling at fifteen years, instead of twenty-five years; and reflect upon the labour necessary to double the produce in fo flort a time, even if we allow it possible; we may venture to pronounce with certainty, that if Mr. Godwin's fystem of society was established in its utmost perfection, instead of myriads of centuries, not thirty years could elapse, before its utter destruction from the simple principle of population.

I have taken no notice of emigration for obvious reasons. If such societies were instituted in other parts of Europe," these countries would be under the same difficulties with regard to population, and could admit no fresh members into their bosons. If this beautiful society were

confined to this island, it must have degenerated strangely from its original purity, and administer but a very small portion of the happiness it proposed; in fhort, its effential principle must be completely destroyed, before any of its members would voluntarily confent to leave it, and live under fuch governments as at prefent exist in Europe, or fubmit to the extreme hardships of first fettlers in new regions. We well know, from repeated experience, how much mifery and hardship men will undergo in their own country, before they can determine to defert it; and how often the most tempting proposals of embarking for new fettlements have been rejected by people who appeared to be almost starving.

CHAP. XI.

Mr. Godwin's conjecture concerning the future extinction of the passion between the sexes.—Little apparent grounds for such a conjecture.—Passion of love not inconsistent either with reason or virtue.

WE have supposed Mr. Godwin's syftem of fociety once completely established. But it is supposing an imposfibility. The fame causes in nature which would destroy it so rapidly, were it once established, would prevent the possibility of its establishment. And upon what grounds we can presume a change in these natural causes, I am utterly at a loss to conjecture. No move towards the extinction of the passion between the fexes has taken place in the five or fix thousand years that the world has existed. Men in the decline of life have, in all ages, declaimed against a passion which they they have ceased to feel, but with as little reason as success. Those who from coldness of constitutional temperament have never felt what love is, will furely be allowed to be very incompetent judges, with regard to the power of this passion, to contribute to the fum of pleafurable fensations in life. Those who have spent their youth in criminal excesses, and have prepared for themselves, as the comforts of their age, corporal debility, and mental remorfe, may well inveigh against fuch pleasures as vain and futile, and unproductive of lasting satisfaction. But the pleasures of pure love will bear the contemplation of the most improved reafon, and the most exalted virtue. Perhaps there is fcarcely a man who has once experienced the genuine delight of virtuous love, however great his intellectual pleasures may have been, that does not look back to the period, as the funny

fpot

fpot in his whole life, where his imagination loves to balk, which he recollects and contemplates with the fondest regrets, and which he would most wish to live over again. The superiority of intellectual, to fensual pleasures, consists rather, in their filling up more time, in their having a larger range, and in their being less liable to satiety, than in their being more real and essential.

Intemperance in every enjoyment defeats its own purpose. A walk in the finest day, through the most beautiful country, if pursued too far, ends in pain and fatigue. The most wholesome and invigorating food, eaten with an unrestrained appetite, produces weakness, instead of strength. Even intellectual pleasures, though certainly less liable than others to satiety, pursued with too little intermission, debilitate the body, and

impair the vigour of the mind. To argue against the reality of these pleasures from their abuse, scems to be hardly just. Morality, according to Mr. Godwin, is a calculation of confequences, or, as Archdeacon Paley very justly expresses it. the will of God, as collected from general expediency. According to either of these definitions, a fenfual pleasure, not attended with the probability of unhappy confequences, does not offend against the laws of morality: and if it be purfued with fuch a degree of temperance, as to leave the most ample room for intellectual attainments, it must undoubtedly add to the fum of pleafurable fensations in life. Virtuous love, exalted by friendship, feems to be that fort of mixture of fenfual and intellectual enjoyment particularly fuited to the nature of man, and most powerfully calculated to awaken the fympathies of the foul, and produce the most exquisite gratifications.

Mr. Godwin fays, in order to flew the evident inferiority of the pleafures of fense, "Strip the commerce of the sexes of all its attendant circumstances *, and it would be generally despised." He might as well fay to a man who admired trees; strip them of their spreading branches and lovely foliage, and what beauty can you fee in a bare pole? But it was the tree with the branches and foliage, and not without them, that excited admiration. One feature of an object, may be as distinct, and excite as different emotions, from the aggregate, as any two things the most remote, as a beautiful woman, and a map of Madagascar. It is "the symmetry of person.

the vivacity, the voluptuous foftness of temper, the affectionate kindness of feelings, the imagination and the wit" of a woman that excite the passion of love, and not the mere distinction of her being a female. Urged by the passion of love, men have been driven into acts highly prejudicial to the general interests of fociety; but probably they would have found no difficulty in refifting the temptation, had it appeared in the form of a woman, with no other attractions whatever but her fex. To strip sensual pleafures of all their adjuncts, in order to prove their inferiority, is to deprive a magnet of some of its most essential causes of attraction, and then to say that it is weak and inefficient.

In the pursuit of every enjoyment, whether fensual or intellectual, Reason, that faculty which enables us to calculate

consequences, is the proper corrective and guide. It is probable therefore that improved reason will always tend to prevent the abuse of sensual pleasures, though it by no means sollows that it will extinguish them.

I have endeavoured to expose the fallacy of that argument which infers an unlimited progrefs from a partial improvement, the limits of which cannot be exactly afcertained. It has appeared, I think, that there are many instances in which a decided progrefs has been obferved, where yet it would be a gross abfurdity to suppose that progress indefinite. But towards the extinction of the passion between the sexes, no observable progrefs whatever has hitherto been made. To suppose such an extinction, therefore, is merely to offer an unfounded conjecture, unsupported by any philosophical probabilities.

It is a truth, which history I am afraid makes too clear, that fome men of the highest mental powers, have been addicted not only to a moderate, but even to an immoderate indulgence in the pleafures of fenfual love. But allowing, as I should be inclined to do, notwithstanding numerous instances to the contrary, that great intellectual exertions tend to diminish the empire of this passion over man; it is evident that the mass of mankind must be improved more highly than the brightest ornaments of the species at prefent, before any difference can take place fufficient fenfibly to affect population. I would by no means suppose that the mass of mankind has reached its term of improvement; but the principal argument of this effay tends to place in a ftrong point of view, the improbability, that the lower classes of people in any country, should ever be sufficiently free from want and labour, to attain any high degree of intellectual improvement.

CHAP. XII.

Mr. Godwin's conjecture concerning the indefinite prolongation of human life.—Improper inference drawn from the effects of mental stimulants on the human frame, illustrated in various instances.—Conjectures not founded on any indications in the past, not to be considered as philosophical conjectures.—Mr. Godwin's and Mr. Condorcet's conjecture respecting the approach of man towards immortality on earth, a curious instance of the inconsistency of scepticism.

Mr. Godwin's conjecture respecting the future approach of man towards immortality on earth, seems to be rather oddly placed in a chapter, which professes to remove the objection to his system of equality from the principle of population. Unless he supposes the passion between the sexes to decrease faster, than the duration of life increases, the earth would be more encumbered than ever. But leaving this difficulty to Mr. God-

win, let us examine a few of the appearances from which the probable immortality of man is inferred.

To prove the power of the mind over the body, Mr. Godwin observes, " How often do we find a piece of good news dissipating a distemper? How common is the remark that those accidents which are to the indolent a fource of difeafe, are forgotten and extirpated in the bufy and active? I walk twenty miles in an indolent and half determined temper, and am extremely fatigued. I walk twenty miles full of ardour, and with a motive that engroffes my foul, and I come in as fresh and as alert as when I began my journey. Emotions excited by fome unexpected word, by a letter that is delivered to us, occasions the most extraordinary revolutions in our frame, accelerates the circulation, causes

the heart to palpitate, the tongue to refuse its office, and has been known to occasion death by extreme anguish or extreme joy. There is nothing indeed of which the physician is more aware than of the power of the mind in assisting or retarding convalescence."

The inftances here mentioned, are chiefly instances of the effects of mental stimulants on the bodily frame. No person has ever for a moment doubted the near, though mysterious connection, of mind and body. But it is arguing totally without knowledge of the nature of stimulants to suppose, either that they can be applied continually with equal strength, or if they could be so applied, for a time, that they would not exhaust and wear out the subject. In some of the cases here noticed, the strength of the stimulus depends upon its novelty and unexpectedness. Such a stimulus cannot, from its nature, be repeated often with the same effect, as it would by repetition lose that property which gives it its strength.

In the other cases, the argument is from a small and partial effect, to a great and general effect, which will in numberless instances be found to be a very fallacious mode of reasoning. The busy and active man may in some degree counteract, or what is perhaps nearer the truth, may disregard those slight disorders of frame, which six the attention of a man who has nothing else to think of; but this does not tend to prove that activity of mind will enable a man to disregard a high sever, the small-pox, or the plague.

The man who walks twenty miles with a motive that engrosses his foul, does not attend to his flight fatigue of body when he comes in: but double his motive, and fet him to walk another twenty miles, quadruple it, and let him start a third time, and so on; and the length of his walk will ultimately depend upon muscle and not mind. Powel, for a motive of ten guineas, would have walked further probably than Mr. Godwin, for a motive of half a million. A motive of uncommon power acting upon a frame of moderate strength, would, perhaps. make the man kill himself by his exertions, but it would not make him walk an hundred miles in twenty-four hours. This statement of the case, shews the fallacy of supposing, that the person was really not at all tired in his first walk of twenty miles, because he did not appear to be fo, or, perhaps, scarcely

felt

felt any fatigue himfelf. The mind cannot fix its attention strongly on more than one object at once. The twenty thousand pounds so engrossed his thoughts, that he did not attend to any flight foreness of foot, or stiffness of limb. But had he been really as fresh and as alert, as when he first set off, he would be able to go the fecond twenty miles with as much eafe as the first, and so on, the third, &c. which leads to a palpable abfurdity. When a horse of spirit is nearly half tired, by the stimulus of the fpur, added to the proper management of the bit, he may be put for much upon his mettle, that he would appear to a stander-by, as fresh and as high spirited, as if he had not gone a mile. Nay, probably, the horse himself, while in the heat and passion occasioned by this stimulus, would not feel any fatigue; but it would be strangely con-

trary to all reason and experience, to argue from fuch an appearance, that if the stimulus were continued, the horse would never be tired. The cry of a pack of hounds will make fome horses, after a journey of forty miles on the road, appear as fresh, and as lively, as when they first set out. Were they then to be hunted, no perceptible abatement would at first be felt by their riders in their strength and spirits, but towards the end of a hard day, the previous fatigue would have its full weight and effect, and make them tire fooner. When I have taken a long walk with my gun, and met with no fuccess, I have frequently returned home feeling a considerable degree of uncomfortableness from fatigue. Another day, perhaps, going over nearly the fame extent of ground with a good deal of sport, I have come home fresh, and alert. The

Q

difference

difference in the fenfation of fatigue upon coming in, on the different days, may have been very striking, but on the following mornings I have found no fuch difference. I have not perceived that I was less stiff in my limbs, or less footfore, on the morning after the day of sport, than on the other morning.

In all these cases, stimulants upon the mind seem to act rather by taking off the attention from the bodily satigue, than by really and truly counteracting it. If the energy of my mind had really counteracted the satigue of my body, why should I feel tired the next morning? If the stimulus of the hounds had as completely overcome the satigue of the journey in reality, as it did in appearance, why should the horse be tired sooner than if he had not gone the forty miles? I happen to have a very bad sit

of the tooth-ache at the time I am writing this. In the eagerness of compofition, I every now and then, for a moment or two, forget it. Yet I cannot help thinking that the process which causes the pain, is still going forwards, and that the nerves, which carry the infermation of it to the brain, are evenduring these moments demanding attention, and room for their appropriate vibrations. The multiplicity of vibrations of another kind, may perhaps prevent their admission, or overcome them for a time when admitted, till a shoot of extraordinary energy puts all other vibrations to the rout, deftroys the vividness of my argumentative conceptions, and rides triumphant in the brain. In this case, as in the others, the mind seems to have little or no power in counteracting, or curing the diforder, but merely

possesses

possesses a power, if strongly excited, of fixing its attention on other subjects.

I do not, however, mean to fay, that a found and vigorous mind has no tendency whatever to keep the body in a fimilar state. So close and intimate is the union of mind and body, that it would be highly extraordinary, if they did not mutually assist each others functions. But, perhaps, upon a comparison, the body has more effect upon the mind, than the mind upon the body. The first object of the mind is to act as purveyor to the wants of the body. When these wants are completely fatisfied, an active mind is indeed apt to wander further, to range over the fields of science, or fport in the regions of imagination, to fancy that it has "fhuffled off this mortal coil," and is feeking its kindred clement. But all these efforts are like the

the vain exertions of the hare in the fable. The flowly moving tortoife, the body, never fails to overtake the mind, however widely and extensively it may have ranged, and the brightest and most energetic intellects, unwillingly as they may attend to the first or second summons, must ultimately yield the empire of the brain to the calls of hunger, or sink with the exhausted body in sleep.

It feems as if one might fay with certainty, that if a medicine could be found to immortalize the body, there would be no fear of its being accompanied by the immortality of the mind. But the immortality of the mind by no means feems to infer the immortality of the body. On the contrary, the greatest conceivable energy of mind would probably exhaust and destroy

the strength of the body. A temperate vigour of mind appears to be favourable to health; but very great intellectual exertions tend rather, as has been often observed, to wear out the scabbard. Most of the instances which Mr. Godwin has brought to prove the power of the mind over the body, and the consequent probability of the immortability of man, are of this latter description, and could such stimulants be continually applied, instead of tending to immortalize, they would tend very rapidly to destroy the human frame.

The probable increase of the voluntary power of man over his animal frame, comes next under Mr. Godwin's consideration, and he concludes by faying, that the voluntary power of some men, in this respect, is sound to extend to various articles in which other

men are impotent. But this is reasoning against an almost universal rule from a few exceptions: and these exceptions seem to be rather tricks, than powers, that may be exerted to any good purpose. I have never heard of any man who could regulate his pulse in a sever; and doubt much, if any of the persons here alluded to, have made the smallest perceptible progress in the regular correction of the disorders of their frames, and the consequent prolongation of their lives.

Mr. Godwin fays, "Nothing can be more unphilosophical, than to conclude, that, because a certain species of power is beyond the train of our present observation, that it is beyond the limits of the human mind." I own my ideas of philosophy are in this respect widely different from Mr. Godwin's. The only

distinction that I see, between a philofophical conjecture, and the affertions of the Prophet Mr. Brothers, is, that one is founded upon indications arising from the train of our present observations, and the other has no foundation at all. I expect that great discoveries are yet to take place in all the branches of human science, particularly in phyfics; but the moment we leave past experience as the foundation of our conjectures concerning the future; and still more, if our conjectures absolutely contradict past experience, we are thrown upon a wide field of uncertainty, and any one supposition is then just as good as another. If a person were to tell me that men would ultimately have eyes and hands behind them as well as before them, I should admit the usefulness of the addition, but should give as a reason for my disbelief of it, that I

faw no indications whatever in the past, from which I could infer the smallest probability of such a change. If this be not allowed a valid objection, all conjectures are alike, and all equally philosophical. I own it appears to me, that in the train of our present observations, there are no more genuine indications that man will become immortal upon earth, than that he will have four eyes and four hands, or that trees will grow horizontally instead of perpendicularly.

It will be faid, perhaps, that many discoveries have already taken place in the world that were totally unforeseen and unexpected. This I grant to be true; but if a person had predicted these discoveries, without being guided by any analogies or indications from past facts, he would deserve the name of seer or prophet, but not of philosopher,

pher. The wonder that some of our modern discoveries would excite in the favage inhabitants of Europe in the times of Thefeus and Achilles, proves but little. Persons almost entirely unacquainted with the powers of a machine, cannot be expected to guess at its effects. I am far from faying, that we are at prefent by any means fully acquainted with the powers of the human mind; but we certainly know more of this instrument than was known four thousand years ago; and therefore, though not to be called competent judges, we are certainly much better able, than favages, to fay what is, or is not, within its grafp. A watch would strike a Savage with as much furprize as a perpetual motion; yet one, is to us a most familiar piece of mechanism, and the other, has confiantly eluded the efforts of the most acute intellects. In many

instances, we are now able to perceive the causes, which prevent an unlimited improvement in those inventions, which feemed to promife fairly for it at first. The original improvers of telescopes would probably think, that as long as the fize of the specula, and the length of the tubes could be increased, the powers and advantages of the instrument would increase: but experience has fince taught us, that the fmallness of the field, the deficiency of light, and the circumstance of the atmosphere being magnified, prevent the beneficial refults that were to be expected from telescopes of extraordinary fize and power. In many parts of knowledge, man has been almost constantly making some progress; in other parts, his efforts have been invariably baffled. The Savage would not probably be able to guess at the causes of this mighty difference. Our further experience

perience has given us fome little infight into these causes, and has therefore enabled us better to judge, if not, of what we are to expect in suture, at least, of what we are not to expect, which, though negative, is a very useful piece of information.

As the necessity of sleep seems rather to depend upon the body than the mind, it does not appear how the improvement of the mind can tend very greatly to supersede this "conspicuous infirmity." A man who by great excitements on his mind, is able to pass two or three nights without sleep, proportionably exhausts the vigour of his body: and this diminution of health and strength, will soon disturb the operations of his understanding; so that by these great efforts, he appears to have made no real progress whatever,

in superseding the necessity of this species of rest.

There is certainly a fufficiently marked difference in the various characters of which we have fome knowledge, relative to the energies of their minds, their benevolent pursuits, &c. to enable us to judge, whether the operations of intellect have any decided effect in prolonging the duration of human life. It is certain, that no decided effect of this kind has yet been observed. Though no attention of any kind, has ever produced fuch an effect, as could be construed into the smallest semblance of an approach towards immortality; yet of the two, a certain attention to the body, feems to have more effect in this respect, than an attention to the mind. The man who takes his temperate meals, and his bodily exercise, with scrupulous

regularity, will generally be found more healthy, than the man who, very deeply engaged in intellectual pursuits, often forgets for a time these bodily cravings. The citizen who has retired, and whose ideas, perhaps, fcarcely foar above, or extend beyond his little garden, pudling all the morning about his borders of box, will, perhaps, live as long as the philosopher whose range of intellect is the most exensive, and whose views are the clearest of any of his contemporaries. It has been positively obferved by those who have attended to the bills of mortality, that women live longer upon an average than men; and, though I would not by any means fay that their intellectual faculties are inferior, yet, I think, it must be allowed, that from their different education, there are not fo many women as men, who

are excited to vigorous mental exer-

As in these and similar instances, or to take a larger range, as in the great diversity of characters that have existed during some thousand years, no decided difference has been observed in the duration of human life from the operation of intellect, the mortality of man on earth feems to be as completely established, and exactly upon the same grounds, as any one, the most constant, of the laws of nature. An immediate act of power in the Creator of the Universe might, indeed, change one or all of these laws, either suddenly or gradually; but without some indications of fuch a change, and fuch indications do not exist, it is just as unphilosophical to suppose that the life of man may be prolonged beyond any assignable limits. mits, as to suppose that the attraction of the earth will gradually be changed into repulsion, and that stones will ultimately rise instead of fall, or that the earth will sly off at a certain period to some more genial and warmer fun.

The conclusion of this chapter prefents us, undoubtedly, with a very beautiful and defireable picture, but like fome of those landscapes, drawn from fancy, and not imagined with truth, it fails of that interest in the heart which nature and probability can alone give.

I cannot quit this subject without taking notice of these conjectures of Mr. Godwin and Mr. Condorcet, concerning the indefinite prolongation of human life, as a very curious instance

of the longing of the foul after immortality. Both these gentlemen have rejected the light of revelation which absolutely promifes eternal life in another state. They have also rejected the light of natural religion, which to the ablest intellects in all ages, has indicated the future existence of the foul. Yet fo congenial is the idea of immortality to the mind of man, that they cannot confent entirely to throw it out of their fystems. After all their fastidious fcepticisms concerning the only probable mode of immortality, they introduce a species of immortality of their own, not only completely contradictory to every law of philosophical probability, but in itself in the highest degree, narrow, partial, and unjust. They suppose that all the great, virtuous, and exalted minds, that have ever existed, or that may exist for some thousands, per-

haps millions of years, will be funk in annihilation; and that only a few beings, not greater in number than can exist at once upon the earth, will be ultimately crowned with immortality. Had fuch a tenet been advanced as a tenet of revelation, I am very fure that all the enemies of religion, and probably Mr. Godwin, and Mr. Condorect among the rest, would have exhausted the whole force of their ridicute upon it, as the most puerile, the most absurd, the poorest, the most pitiful, the most iniquitously unjust, and, confequently, the most unworthy of the Deity, that the fuperstitious folly of man could invent.

What a strange and curious proof do these conjectures exhibit of the inconsistency of scepticism! For it should be observed, that there is a very strik-

ing and effential difference, between believing an affertion which absolutely contradicts the most uniform experience, and an affertion which contradicts nothing, but is merely beyond the power of our present observation and knowledge *. So diversified are the natural objects

* When we extend our view beyond this life. it is evident that we can have no other guides than authority, or conjecture, and perhaps, indeed, an obscure and undefined feeling. What I say here, therefore, does not appear to me in any respect to contradict what I faid before, when I observed that it was unphilosophical to expect any specifick event that was not indicated by some kind of analogy in the past. In ranging beyond the bourne from which no traveller returns, we must necessarily quit this rule; but with regard to events that may be expected to happen on earth, we can feldom quit it confishently with true philosophy. Analogy has, however, as I conceive, great latitude, For instance, man has discovered many of the laws of nature: analogy feems to indicate that he will

dif-

objects around us, fo many instances of mighty power daily offer themselves to our view, that we may fairly prefume, that there are many forms and operations of nature which we have not yet observed, or which, perhaps, we are not capable of observing with our prefent confined inlets of knowledge. The refurrection of a spiritual body from a natural body, does not appear in itself a more wonderful instance of power, than the germination of a blade of wheat from the grain, or of an oak from an acorn. Could we conceive an intelligent being, fo placed, as to be conversant only with inanimate, or full grown objects, and never to have witneffed the process of vegetation or growth; and were ano-

discover many more; but no analogy seems to indicate that he will discover a fixth sense, or a new species of power in the human mind, entirely beyond the train of our present observations. ther being to shew him two little pieces of matter, a grain of wheat, and an acorn, to defire him to examine them, to analize them if he pleafed, and endeavour to find out their properties and effences; and then to tell him, that however trifling these little bits of matter might appear to him, that they poffessed such curious powers of selection, combination, arrangement, and almost of creation, that upon being put into the ground, they would chuse, amongst all the dirt and moisture that furroundedthem, those parts which best suited their purpose, that they would collect and arrange these parts with wonderful taste, judgment, and execution, and would rife up into beautiful forms, scarcely in any respect analogous to the little bits of matter which were first placed in the earth. I feel very little doubt that the imaginary being which I have

fup-

fupposed, would hesitate more, would require better authority, and stronger proofs, before he believed these strange affertions, than if he had been told, that a being of mighty power, who had been the cause of all that he saw around him, and of that existence of which he himself was conscious, would, by a great act of power upon the death and corruption of human creatures, raise up the essence of thought in an incorporeal, or at least invisible form, to give it a happier existence in another state.

The only difference, with regard to our own apprehensions, that is not in favour of the latter affertion, is, that the first miracle* we have repeatedly seen,

and

^{*} The powers of selection, combination, and transmutation, which every seed shews, are truely miraculous. Who can imagine that these wonderful faculties

and the last miracle we have not seen. I admit the full weight of this prodigious difference; but surely no man can hesitate a moment in faying, that putting Revelation out of the question, the re-

culties are contained in these little bits of matter? To me it appears much more philosophical to suppose that the mighty God of nature is present in full energy in all these operations. To this all powerful Being, it would be equally easy to raise an oak without an acorn as with one. The preparatory process of putting feeds into the ground, is merely ordained for the use of man, as one among the various other excitements necessary to awaken matter into mind. It is an idea that will be found, confistent equally with the natural phenomena around us, with the various events of human life, and with the successive Revelations of God to man, to suppose that the world is a mighty process for the creation and formation of mind. Many vessels will necessarily come out of this great furnace in wrong shapes. These will be broken and thrown aside as useless; while those vessels whose forms are full of truth, grace, and loveliness, will be wafted into happier fituations, nearer the presence of the mighty maker.

furrection

furrection of a spiritual body from a natural body, which may be merely one among the many operations of nature which we cannot see, is an event indefinitely more probable than the immortality of man on earth, which is not only an event, of which no symptoms or indications have yet appeared, but is a post-tive contradiction to one of the most constant of the laws of nature that has ever come within the observation of man.

I ought perhaps again to make an apology to my readers for dwelling fo long upon a conjecture, which many I know will think too abfurd and improbable, to require the least discussion. But if it be as improbable, and as contrary to the genuine spirit of philosophy as I own I think it is, why should it not be shewn to be so in a candid examination? A conjecture, however improbable on the first

first view of it, advanced by able and ingenious men, feems at least to deferve investigation. For my own part I feel no difinclination whatever, to give that degree of credit to the opinion of the probable immortality of man on earth, which the appearances that ean be brought in support of it deserve. Before we decide upon the utter improbability of fuch an event, it is but fair impartially to examine these appearances; and from such an examination I think we may conclude, that we have rather less reason for suppofing that the life of man may be indefinitely prolonged, than that trees may be made to grow indefinitely high, or potatoes indefinitely large*.

* Though Mr. Godwin advances the idea of the indefinite prolongation of human life, merely as a conjecture, yet as he has produced fome appearances, which in his conception favour the supposition, he must certainly intend that these appearances should be examined; and this is all that I have meant to do.

CHAP. XIII.

Error of Mr. Godwin in considering man too much in the light of a being merely rational.—In the compound being, man, the passions will always act as disturbing forces in the decisions of the understanding.—Reasonings of Mr. Godwin on the subject of coercion.—Some truths of a nature not to be communicated from one man to another.

IN the chapter which I have been exaamining, Mr. Godwin professes to confider the objection to his fystem of equality from the principle of population. It has appeared I think clearly, that he is greatly erroneous in his flatement of the distance of this difficulty; and that instead of myriads of centuries, it is really not thirty years, or even thirty days, diftant from us. The supposition of the approach of man to immortality on earth, is certainly not of a kind to foften the difficulty. The only argument,

gument, therefore, in the chapter, which has any tendency to remove the objection, is the conjecture concerning the extinction of the passion between the sexes; but as this is a mere conjecture, unfupported by the fmallest shadow of proof, the force of the objection may be fairly faid to remain unimpaired; and it is undoubtedly of fufficient weight of itself completely to overturn Mr. Godwin's whole fystem of equality. I will, however, make one or two observations on a few of the prominent parts of Mr. Godwin's reasonings, which will contribute to place in a still clearer point of view, the little hope that we can reafonably entertain of those vast improvements in the nature of man and of fociety, which he holds up to our admiring gaze in his political justice.

Mr. Godwin confiders man too much in the light of a being merely intellectual. This error, at least such I conceive it to be, pervades his whole work, and mixes itself with all his reasonings. The voluntary actions of men may originate in their opinions; but these opinions will be very differently modified in creatures compounded of a rational faculty and corporal propensities, from what they would be, in beings wholly intellectual. Mr. Godwin, in proving that found reafoning and truth, are capable of being adequately communicated, examines the proposition first practically; and then adds, "Such is the appearance which this proposition assumes, when examined in a loofe and practical view. In strict confideration it will not admit of debate. Man is a rational being, &c*." So far

^{*} B 1, C. 5. P. 89.

from calling this a strict consideration of the fubject, I own I should call it the loofest, and most erroneous way possible, of confidering it. It is the calculating the velocity of a falling body in vacuo; and perfifting in it, that it would be the fame through whatever refisting mediums it might fall. This was not Newton's mode of philosophizing. Very few general propositions are just in application to a particular fubject. The moon is not kept in her orbit round the earth, nor the earth in her orbit round the fun, by a force that varies merely in the inverse ratio of the fquares of the distances. To make the general theory just in application to the revolutions of these bodies, it was necessary to calculate accurately, the disturbing force of the sun upon the moon, and of the moon upon the earth; and till these disturbing forces were properly estimated, actual observations on the motions of these bodies, would have proved

proved that the theory was not accurately true.

I am willing to allow that every voluntary act is preceded by a decision of the mind; but it is strangely opposite to what I should conceive to be the just theory upon the subject, and a palpable contradiction to all experience, to fay, that the corporal propensities of man do not act very powerfully, as difturbing forces, in these decisions. The queftion, therefore, does not merely depend, upon whether a man may be made to understand a distinct proposition, or be convinced by an unanswerable argument. A truth may be brought home to his conviction as a rational being, though he may determine to act contrary to it, as a compound being. The cravings of hunger, the love of liquor, the defire of possessing a beautiful woman, will

urge men to actions, of the fatal confequences of which, to the general interests of society, they are perfectly well convinced, even at the very time they commit them. Remove their bodily cravings, and they would not hefitate a moment in determining against such actions. Ask them their opinion of the fame conduct in another person, and they would immediately reprobate it. But in their own cafe, and under all the circumstances of their situation with these bodily cravings, the decision of the compound being is different from the conviction of the rational being.

If this be the just view of the subject; and both theory and experience unite to prove that it is; almost all Mr. Godwin's reasonings on the subject of coercion in his 7th chapter, will appear to be founded on error. He spends some time in placing

in a ridiculous point of view, the attempt, to convince a man's understanding, and to clear up a doubtful propofition in his mind, by blows. Undoubtedly it is both ridiculous and barbarous'; and fo is cock-fighting; but one has little more to do with the real object of human punishments, than the other. One frequent (indeed much too frequent) mode of punishment is death. Mr. Godwin will hardly think this intended for conviction; at least it does not appear how the individual, or the fociety, could reap much future benefit from an understanding enlightened in this manner.

The principal objects which human punishments have in view, are undoubtedly. restraint and example: restraint, or removal of an individual member, whose vicious habits are likely to be prejudicial to the society. And example, which

by expressing the fense of the community with regard to a particular crime, and by affociating more nearly and vifibly, crime and punishment, holds out a moral motive to diffuade others from the commission of it.

Restraint, Mr. Godwin thinks, may be permitted as a temporary expedient, though he reprobates folitary imprisonment, which has certainly been the most fuccessful, and, indeed, almost the only attempt, towards the moral amelioration of offenders. He talks of the felfish passions that are fostered by solitude, and of the virtues generated in fociety. furely these virtues are not generated in the fociety of a prison. Were the offender confined to the fociety of able and virtuous men, he would probably be more improved than in folitude: But is this practicable? Mr. Godwin's

ingenuity is more frequently employed in finding out evils, than in fuggesting practical remedies.

Punishment, for example, is totally reprobated. By endeavouring to make examples too impressive and terrible, nations have, indeed, been led into the most barbarous cruelties; but the abuse of any practice is not a good argument against its use. The indefatigable pains taken in this country to find out a murder, and the certainty of its punishment, has powerfully contributed to generate that fentiment which is frequent in the mouths of the common people, that a murder will fooner or later come to light; and the habitual horror in which murder is in confequence held, will make a man, in the agony of passion, throw down his knife, for fear he should be tempted to use it in the gratification of his revenge.

In Italy, where murderers by flying to a fanctuary, are allowed more frequently to escape, the crime has never been held in the same detestation, and has consequently been more frequent. No man, who is at all aware of the operation of moral motives, can doubt for a moment, that if every murder in Italy had been invariably punished, the use of the stilletto in transports of passion, would have been comparatively but little known.

That human laws, either do, or can, proportion the punishment accurately to the offence, no person will have the solly to assert. From the inscrutability of motives the thing is absolutely impossible: but this impersection, though it may be called a species of injustice, is no valid argument against human laws. It is the lot of man, that he will fre-

quently have to chuse between two evils; and it is a sufficient reason for the adoption of any institution, that it is the best mode that suggests itself of preventing greater evils. A continual endeavour should undoubtedly prevail to make these institutions as perfect as the nature of them will admit. But nothing is so easy, as to find fault with human institutions; nothing so difficult, as to suggest adequate practical improvements. It is to be lamented, that more men of talents employ their time in the former occupation, than in the latter.

The frequency of crime among men, who, as the common faying is, know better, fufficiently proves, that fome truths may be brought home to the conviction of the mind without always producing the proper effect upon the conduct. There are other truths of a

nature that perhaps never can be adequately communicated from one man to another. The fuperiority of the pleafures of intellect to those of sense. Mr. Godwin confiders as a fundamental truth. Taking all circumstances into consideration, I should be disposed to agree with him; but how am I to communicate this truth to a person who has scarcely ever felt intellectual pleasure. I may as well attempt to explain the nature and beauty of colours to a blind man. If I am ever fo laborious, patient, and clear, and have the most repeated opportunities of expostulation, any real progress toward the accomplishment of my purpose, feems absolutely hopeless. There is no common measure between us. I cannot proceed step by step: it is a truth of a nature absolutely incapable of demonstration. All that I can say is, that the wifest and best men in all ages had agreed

in giving the preference, very greatly, to the pleasures of intellect; and that my own experience completely confirmed the truth of their decisions: that I had found fenfual pleafures vain, transfient, and continually attended with tedium and difgust; but that intellectual pleasures appeared to me ever fresh and young, filled up all my hours fatisfactorily, gave a new zest to life, and diffused a lasting ferenity over my mind. If he believe me, it can only be from respect and veneration for my authority: it is credulity, and not conviction. I have not faid any thing, nor can any thing be faid of a nature to produce real conviction. The affair is not an affair of reasoning, but of experience. He would probably observe in reply, what you fay may be very true with regard to yourfelf and many other good men, but for my own part I feel very differently upon the subject. I have

very frequently taken up a book, and almost as frequently gone to sleep over it; but when I pass an evening with a gay party, or a pretty woman, I feel alive, and in spirits, and truly enjoy my existence.

Under fuch circumstances, reasoning and argument are not instruments from which success can be expected. At some suture time perhaps, real satiety of sensual pleasures, or some accidental impressions that awakened the energies of his mind, might effect that, in a month, which the most patient and able expostulations, might be incapable of effecting in sorty years.

CHAP. XIV.

Mr. Godwin's five propositions respecting political truth, on which his whole work hinges, not established.—Reasons we have for supposing from the distress occasioned by the principle of population, that the vices, and moral weakness of man can never be wholly eradicated.—Perfectibility, in the sense in which Mr. Godwin uses the term, not applicable to man.—Nature of the real perfectibility of man illustrated.

Ir the reasonings of the preceding chapter are just, the corollaries respecting political truth, which Mr. Godwin draws from the proposition, that the voluntary actions of men originate in their opinions, will not appear to be clearly established. These corollaries are, "Sound reasoning and truth, when adequately communicated, must always be victorious over error: Sound reasoning and truth are capable of being so communicated: Truth is omnipotent: The vices and moral weak-

weakness of man are not invincible: Man is perfectible, or in other words, susceptible of perpetual improvement."

The first three propositions may be confidered a complete fyllogism. If by adequately communicated, be meant fuch a conviction as to produce an adequate effect upon the conduct; the major may be allowed, and the minor denied. The confequent, or the omnipotence of truth, of course falls to the ground. If by adequately communicated be meant merely the conviction of the rational faculty; the major must be denied, the minor will be only true in cases capable of demonstration, and the consequent equally falls. The fourth proposition, Mr. Godwin calls the preceding proposition, with a flight variation in the statement. If so, it must accompany the preceding proposition in its fall. But it may be worth while

while to inquire, with reference to the principal argument of this effay, into the particular reasons which we have for supposing, that the vices and moral weakness of man can never be wholly overcome in this world.

Man, according to Mr. Godwin, is a creature, formed what he is, by the fuccessive impressions which he has received, from the first moment that the germ from which he fpring was animated. Could he be placed in a fituation, where he was fubject to no evil impressions whatever, though it might be doubted whether in fuch a fituation virtue could exist, vice would certainly be banished. The great bent of Mr. Godwin's work on political justice, if I understand it rightly, is to fhew, that the greater part of the vices and weaknesses of men, proceed from the injustice of their political and social instiinstitutions: and that if these were removed, and the understandings of men more enlightened, there would be little or no temptation in the world to evil. As it has been clearly proved, however, (at least as I think) that this is entirely a false conception, and that, independent of any political or focial inftitutions whatever, the greater part of mankind, from the fixed and unalterable laws of nature, must ever be subject to the evil temptations arising from want, besides other passions; it follows from Mr. Godwin's definition of man, that fuch impressions, and combinations of impressions, cannot be afloat in the world, without generating a variety of bad men. According to Mr. Godwin's own conception of the formation of character, it is furely as improbable that under fuch circumstances, all men will be virtuous, as that fixes will come up a hundred times

following upon the dice. The great variety of combinations upon the dice in a repeated fuccession of throws, appears to me not inaptly to represent the great variety of character that must necessarily exist in the world, supposing every individual to be formed what he is, by that combination of impressions which he has received fince his first existence. And this comparison will, in fome measure, shew the absurdity of fuppofing, that exceptions will ever become general rules; that extraordinary and unufual combinations will be frequent; or that the individual instances of great virtue which have appeared in all ages of the world, will ever prevail univerfally.

I am aware that Mr. Godwin might fay, that the comparison is in one respect inaccurate; that in the case of the dice,

dice, the preceding causes, or rather the chances respecting the preceding causes. were always the fame; and that, therefore, I could have no good reason for supposing that a greater number of fixes would come up in the next hundred. times of throwing, than in the preceding same number of throws. But, that man had in some fort a power of influencing those causes that formed character: and that every good and virtuous man that was produced, by the influence which he must necessarily have, rather increased the probability that another fuch virtuous character would be generated; whereas the coming up of fixes upon the dice once, would certainly not increase the probability of their coming up a fecond time. I admit this objection to the accuracy of the comparison, but it is only partially

valid. Repeated experience has affured us, that the influence of the most virtuous character will rarely prevail against very ftrong temptations to evil. It will undoubtedly affect fome, but it will fail with a much greater number. Had Mr. Godwin fucceeded in his attempt to prove that thefe temptations to evil could by the exertions of man be removed, I would give up the comparifon; or at least allow, that a man might be fo far enlightened with regard to the mode of shaking his elbow, that he would be able to throw fixes every time. But as long as a great number of those impressions which form character, like the nice motions of the arm, remain absolutely independent of the will of man; though it would be the height of folly and prefumption, to attempt to calculate the relative proportions

portions of virtue and vice at the future periods of the world; it may be fafely afferted, that the vices and moral weakness of mankind, taken in the mass, are invincible.

The fifth proposition, is the general deduction from the four former, and will confequently fail, as the foundations which support it have given way. In the fense in which Mr. Godwin understands the term perfectible, the perfectibility of man cannot be afferted. unless the preceding propositions could have been clearly established. There is, however, one fenfe, which the term will bear, in which it is, perhaps, just. It may be faid with truth, that man is always fusceptible of improvement; or that there never has been, or will be, a period of his history, in which he can be faid to have reached his possi-

ble achmè of perfection. Yet it does not by any means follow from this, that our efforts to improve man will always fucceed; or even, that he will ever make, in the greatest number of ages, any extraordinary strides towards perfection. The only inference that can be drawn, is, that the precise limit of his improvement cannot possibly be known. And I cannot help again reminding the reader of a distinction, which, it appears to me, ought particularly to be attended to in the prefent question; I mean, the effential difference there is, between an unlimited improvement, and an improvement the limit of which cannot be afcertained. The former is an improvement not applicable to man under the prefent laws of his nature. The latter, undoubtedly, is applicable.

The real perfectibility of man may be illustrated, as I have mentioned before, by the perfectibility of a plant. The object of the enterprizing florist, is, as I conceive, to unite fize, fymmetry, and beauty of colour. It would furely be prefumptuous in the most fuccessful improver to affirm, that he possessed a carnation in which these qualities existed in the greatest possible state of perfection. However beautiful his flower may be, other care, other foil, or other funs, might produce one still more beautiful. Yet, although he may be aware of the abfurdity of supposing that he has reached perfection; and though he may know by what means he attained that degree of beauty in the flower which he at prefent possesses, yet he cannot be fure that by purfuing fimilar means, rather increased in strength, he will obtain a more beautiful bloffom. By endeavouring

vouring to improve one quality, he may impair the beauty of another. The richer mould which he would employ to increase the fize of his plant, would probably burst the calyx, and deftroy at once its fymmetry. In a fimilar manner, the forcing manure afed to bring about the French revolution, and to give a greater freedom and energy to the human mind, has burst the calyx of humanity, the reftraining bond of all fociety; and, however large the feparate petals have grown; however strongly, or even beautifully a few of them have been marked; the whole is at prefent a loofe, deformed, disjointed mass, without union, fymmetry, or harmony of colouring.

Were it of confequence to improve pinks and carnations, though we could have

have no hope of raising them as large as cabbages, we might undoubtedly expect, by fuccessive efforts, to obtain more beautiful specimens than we at present possess. No person can deny the importance of improving the happiness of the human species. Every, the least advance in this respect, is highly valuable. But an experiment with the human race is not like an experiment upon inanimate objects. The burfting of a flower may be a trifle. Another will foon fucceed it. But the burfting of the bonds of fociety is fuch a feparation of parts as cannot take place without giving the most acute pain to thousands: and a long time may elapse, and much mifery may be endured, before the wound grows up again.

As the five propositions which I have been examining may be considered as

the corner stones of Mr. Godwin's fanciful structure; and, indeed, as expreffing the aim and bent of his whole work; however excellent much of his detached reasoning may be, he must be confidered as having failed in the great object of his undertaking. Befides the difficulties arifing from the compound nature of man, which he has by no means fufficiently smoothed; the principal argument against the perfectibility of man and fociety remains whole and unimpaired from any thing that he has advanced. And as far as I can trust my own judgment, this argument appears to be conclusive, not only against the perfectibility of man, in the enlarged fense in which Mr. Godwin understands the term, but against any very marked and striking change for the better, in the form and structure of general fociety; by which I mean.

mean, any great and decided amelioration of the condition of the lower classes of mankind, the most numerous, and, confequently, in a general view of the fubject, the most important part of the human race. Were I to live a thoufand years, and the laws of nature to remain the fame, I should little fear, or rather little hope, a contradiction from experience, in afferting, that no possible facrifices or exertions of the rich, in a country which had been long inhabited, could for any time place the lower classes of the community in a fituation equal, with regard to circumstances, to the situation of the common people, about thirty years ago, in the northern States of America,

The lower classes of people in Europe may, at some suture period, be much better instructed than they are

at present; they may be taught to employ the little spare time they have in many better ways than at the alehouse; they may live under better and more equal laws than they have ever hitherto done, perhaps, in any country; and I even conceive it possible, though not probable, that they may have more leifure; but it is not in the nature of things, that they can be awarded fuch a quantity of money or subsistence, as will allow them all to marry early, in the full confidence that they shall be able to provide with ease for a numerous family.

CHAP. XV.

Models too perfect, may sometimes rather impede than promote improvement.—Mr. Godwin's essay on avarice and profusion.—Impossibility of dividing the necessary labour of a society amicably among all.—Invectives against labour may produce present evil, with little or no chance of producing suture good.—An accession to the mass of agricultural labour must always be an advantage to the labourer.

MR. Godwin in the preface to his Enquirer, drops a few expressions which feem to hint at some change in his opinions since he wrote the Political Justice; and as this is a work now of some years standing, I should certainly think, that I had been arguing against opinions, which the author had himself seen reason to alter, but that in some of the essays of the Enquirer, Mr. Godwin's peculiar mode of thinking, appears in as striking a light as ever.

It has been frequently observed, that though we cannot hope to reach perfection in any thing, yet that it must always be advantageous to us, to place before our eyes the most perfect models. This observation has a plaufible appearance, but is very far from being generally true. I even doubt its truth in one of the most obvious exemplifications that would occur. I doubt whether a very young painter would receive fo much benefit, from an attempt to copy a highly finished and perfect picture, as from copying one where the outlines were more strongly marked, and the manner of laying on the colours was more eafily discoverable. But in cases, where the perfection of the model, is a perfection of a different and superior nature from that, towards which we fhould naturally advance, we shall not only always fail in making any progrefs towards it, but we shall

in all probability impede the progress, which we might have expected to make, had we not fixed our eyes upon so perfect a model. A highly intellectual being, exempt from the infirm calls of hunger or sleep, is undoubtedly a much more perfect existence than man: but were man to attempt to copy such a model, he would not only fail in making any advances towards it; but by unwisely straining to imitate what was inimitable, he would probably destroy the little intellect which he was endeavouring to improve.

The form and structure of society which Mr. Godwin describes, is as effentially distinct from any forms of society which have hitherto prevailed in the world, as a being that can live without food or sleep is from a man. By improving society in its present form, we are making no more advances to-

wards fuch a state of things as he pictures, than we should make approaches towards a line, with regard to which we were walking parallel. The question, therefore is, whether, by looking to such a form of society as our polar star, we are likely to advance or retard the improvement of the human species? Mr. Godwin appears to me to have decided this question against himself in his essay on avarice and profusion in the Enquirer.

Dr. Adam Smith has very justly obferved, that nations, as well as individuals, grow rich by parsimony, and poor by profusion; and that, therefore, every frugal man was a friend, and every spendthrift an enemy to his country. The reafon he gives is, that what is faved from revenue is always added to stock, and is therefore taken from the maintenance of labour that is generally unproduc-

tive.

tive, and employed in the maintenance of labour that realizes itself in valuable commodities. No observation can be more evidently just. The subject of Mr. Godwin's essay is a little similar in its first appearance, but in essence is as distinct as possible. He considers the mischief of profusion, as an acknowledged truth; and therefore makes his comparifon between the avaricious man, and the man who fpends his income. But the avaricious man of Mr. Godwin, is totally a diffinct character, at least with regard to his effect upon the prosperity of the state, from the frugal man of Dr. Adam Smith. The frugal man in order to make more money, faves from his income, and adds to his capital; and this capital he either employs himfelf in the maintenance of productive labour, or he lends it to fome other perfon, who will probably employ it in this

way. He benefits the state, because he adds to its general capital; and because wealth employed as capital, not only fets in motion more labour, than when fpent as income, but the labour is befides of a more valuable kind. But the avaricious man of Mr. Godwin locks up his wealth in a cheft, and fets in motion no labour of any kind, either productive or unproductive. This is fo effential a difference, that Mr. Godwin's decision in his essay, appears at once as evidently false, as Dr. Adam Smith's position is evidently true. It could not, indeed, but occur to Mr. Godwin, that fome prefent inconvenience might arife to the poor, from thus locking up the funds destined for the maintenance of labour. The only way, therefore, he had of weakening this objection, was to compare the two characters chiefly with regard to their tendency to accelerate the approach

approach of that happy state of cultivated equality, on which he says we ought always to fix our eyes as our polar star.

I think it has been proved in the former parts of this effay, that fuch a state of fociety is absolutely impracticable. What confequences then are we to expect from looking to fuch a point, as our guide and polar star, in the great fea of political discovery? Reason would teach us to expect no other, than winds perpetually adverse, constant but fruitless toil, frequent shipwreck, and certain mifery. We shall not only fail in making the fmallest real approach towards fuch a perfect form of fociety; but by wasting our strength of mind and body, in a direction in which it is impossible to proceed, and by the frequent diffress which we must necessarily occasion by

our repeated failures, we shall evidently impede that degree of improvement in society, which is really attainable.

It has appeared that a fociety constituted according to Mr. Godwin's fystem, must, from the inevitable laws of our nature, degenerate into a class of proprietors, and a class of labourers; and that the substitution of benevolence, for felf-love, as the moving principle of fociety, instead of producing the happy effects that might be expected from fo fair a name, would cause the same presfure of want to be felt by the whole of fociety, which is now felt only by a part. It is to the established administration of property, and to the apparently narrow principle of felf-love, that we are indebted for all the noblest exertions of human genius, all the finer and more delicate emotions of the foul, for every thing.

thing, indeed, that distinguishes the civilized, from the savage state; and no sufficient change, has as yet taken place in the nature of civilized man, to enable us to say, that he either is, or ever will be, in a state, when he may safely throw down the ladder by which he has risen to this eminence.

If in every fociety that has advanced beyond the favage state, a class of proprietors, and a class of labourers*, must neces-

* It should be observed, that the principal argument of this essay, only goes to prove the necessity of a class of proprietors, and a class of labourers, but by no means infers, that the present great inequality of property, is either necessary or useful to society. On the contrary, it must certainly be considered as an evil, and every institution that promotes it, is essentially bad and impolitic. But whether a government could with advantage to society actively interfere to repress inequality of fortunes, may be a matter of doubt.

necessarily exist, it is evident, that, as labour is the only property of the class of labourers, every thing that tends to diminish the value of this property, must tend to diminish the possessions of this part of fociety. The only way that a poor man has of supporting himself in independence, is by the exertion of his bodily strength. This is the only commodity he has to give in exchange for the necessaries of life. It would hardly appear then that you benefit him, by narrowing the market for this commodity, by decreasing the demand for labour, and lessening the value of the only property that he possesses.

doubt. Perhaps the generous system of perfect liberty, adopted by Dr. Adam Smith, and the French economists, would be ill exchanged for any system of restraint.

Mr. Godwin would perhaps fay, that the whole fystem of barter and exchange, is a vile and iniquitous traffic. If you would effentially relieve the poor man, you should take a part of his labour upon yourfelf, or give him your money, without exacting fo fevere a return for it. In answer to the first method proposed, it may be observed, that even if the rich could be perfuaded to assist the poor in this way, the value of the assistance would be comparatively trifling. The rich, though they think themselves of great importance, bear but a small proportion in point of numbers to the poor, and would, therefore, relieve them but of a small part of their burdens by taking a fhare. Were all those that are employed in the labours of luxuries, added to the number of those employed in producing necessaries; and could these necessary labours be amicably divided

U

among all, each man's fhare might indeed be comparatively light; but defireable as fuch an amicable division would undoubtedly be, I cannot conceive any practical principle * according to which it could take place. It has been shewn, that the spirit of benevolence, guided by the strict impartial justice that Mr. Godwin describes, would, if vigorously acted upon, deprefs in want and mifery the whole human race. Let us examine what would be the confequence, if the proprietor were to retain a decent share for himfelf; but to give the rest away to

* Mr. Godwin feems to have but little respect for practical principles; but I own it appears to me, that he is a much greater benefactor to mankind, who points out how an inferior good may be attained, than he who merely expatiates on the deformity of the present state of society, and the beauty of a different state, without pointing out a practical method, that might be immediately applied, of accelerating our advances from the one, to the other.

the poor, without exacting a task from them in return. Not to mention the idleness and the vice that such a proceeding, if general, would probably create in the present state of society, and the great risk there would be, of diminishing the produce of land, as well as the labours of luxury, another objection yet remains.

It has appeared that from the principle of population, more will always be in want than can be adequately fupplied. The furplus of the rich man might be fufficient for three, but four will be defirous to obtain it. He cannot make this felection of three out of the four, without conferring a great favour on those that are the objects of his choice. These persons must consider themselves as under a great obligation to him, and as dependent upon him for their support.

The

The rich man would feel his power, and the poor man his dependence; and the evil effects of these two impressions on the human heart are well known. Though I perfectly agree with Mr. Godwin therefore in the evil of hard labour; yet I still think it a less evil, and less calculated to debase the human mind, than dependence; and every history of man that we have ever read, places in a strong point of view, the danger to which that mind is exposed, which is intrusted with constant power.

In the present state of things, and particularly when labour is in request, the man who does a days work for me, confers sull as great an obligation upon me, as I do upon him. I possess what he wants; he possesses what I want. We make an amicable exchange. The

poor

poor man walks erect in confcious independence; and the mind of his employer is not vitiated by a fense of power.

Three or four hundred years ago, there was undoubtedly much lefs labour in England, in proportion to the population, than at prefent; but there was much more dependence: and we probably should not now enjoy our prefent degree of civil liberty, if the poor, by the introduction of manufactures, had not been enabled to give fomething in exchange for the provifions of the great Lords, instead of being dependent upon their bounty. Even the greatest enemies of trade and manufactures, and I do not reckon myfelf a very determined friend to them, must allow, that when they were in-

U 3

troduced

troduced into England, liberty came in their train.

Nothing that has been faid, tends in the most remote degree to undervalue the principle of benevolence. It is one of the noblest and most godlike qualities of the human heart, generated perhaps, flowly and gradually from felf-love; and afterwards intended to act as a general law, whose kind office it should be, to soften the partial deformities, to correct the afperities, and to fmooth the wrinkles of its parent: and this feems to be the analogy of all nature. Perhaps there is no one general law of nature that will not appear, to us at least, to produce partial evil; and we frequently observe at the fame time, fome bountiful provision, which acting as another general law, corrects the inequalities of the first.

The proper office of benevolence is to foften the partial evils arising from felf-love, but it can never be substituted in its place. If no man were to allow himfelf to act, till he had completely determined, that the action he was about to perform, was more conducive than any other to the general good, the most enlightened minds would hesitate in perplexity and amazement; and the unenlightened, would be continually committing the grossest mistakes.

As Mr. Godwin, therefore, has not laid down any practical principle, according to which the necessary labours of agriculture might be amicably shared among the whole class of labourers; by general invectives against employing the poor, he appears to pursue an unattainable good through much present evil. For if every man who employs the poor, ought to be

confidered as their enemy, and as adding to the weight of their oppressions; and if the mifer is, for this reason, to be preferred to the man who fpends his income, it follows, that any number of men who now fpend their incomes, might, to the advantage of fociety, be converted into mifers. Suppose then, that a hundred thousand persons who now employ ten men each, were to lock up their wealth from general use, it is evident, that a million of working men of different kinds would be completely thrown out of all employment. The extensive mifery that fuch an event would produce in the prefent state of fociety, Mr. Godwin himself could hardly refuse to acknowledge; and I question whether he might not find fome difficulty in proving, that a conduct of this kind tended more than the conduct of those who fpend their incomes to " place human

human beings in the condition in which they ought to be placed."

But Mr. Godwin fays, that the mifer really locks up nothing; that the point has not been rightly understood; and that the true development and definition of the nature of wealth have not been applied to illustrate it. Having defined therefore wealth, very justly, to be the commodities raifed and fostered by human labour, he observes, that the mifer locks up neither corn, nor oxen, nor clothes, nor houses. Undoubtedly he does not really lock up these articles, but he locks up the power of producing them, which is virtually the fame. These things are certainly used and confumed by his contemporaries, as truly, and to as great an extent, as if he were a beggar; but not to as great an extent, as if he had employed his wealth, in turning up more land, in breeding more oxen, in employing more taylors, and in building more houses. But supposing, for a moment, that the conduct of the miser did not tend to check any really useful produce, how are all those, who are thrown out of employment, to obtain patents which they may shew in order to be awarded a proper share of the food and raiment produced by the society? This is the unconquerable difficulty.

I am perfectly willing to concede to Mr. Godwin that there is much more labour in the world than is really necessary; and that, if the lower classes of fociety could agree among themselves never to work more than fix or seven hours in the day, the commodities effential to human happiness might still be produced in as great abundance as at present. But it is almost impossible to conceive

conceive that fuch an agreement could be adhered to. From the principle of population, fome would necessarily be more in want than others. Those that had large families, would naturally be desirous of exchanging two hours more of their labour for an ampler quantity of subsistence. How are they to be prevented from making this exchange? It would be a violation of the first and most facred property that a man possesses, to attempt, by positive institutions, to interfere with his command over his own labour.

Till Mr. Godwin, therefore, can point out fome practical plan according to which the necessary labour in a fociety might be equitably divided; his invectives against labour, if they were attended to, would certainly produce much present evil, without approximating us

which he looks forward as his polar star; and which, he seems to think, should at present be our guide in determining the nature and tendency of human actions. A mariner guided by such a polar star is in danger of shipwreck.

Perhaps there is no possible way in which wealth could, in general, be employed fo beneficially to a state, and particularly to the lower orders of it, as by improving and rendering productive that land, which to a farmer would not answer the expence of cultivation. Had Mr. Godwin exerted his energetic eloquence in painting the fuperior worth and usefulness of the character who employed the poor in this way, to him who employed them in narrow luxuries, every enlightened man must have applauded his efforts. The increasing demand demand for agricultural labour must always tend to better the condition of the poor; and if the accession of work be of this kind, so far is it from being true, that the poor would be obliged to work ten hours, for the same price, that they before worked eight, that the very reverse would be the sact; and a labourer might then support his wife and samily as well by the labour of six hours, as he could before by the labour of eight.

The labour created by luxuries, though useful in distributing the produce of the country, without vitiating the proprietor by power, or debasing the labourer by dependence, has not, indeed, the same beneficial effects on the state of the poor. A great accession of work from manufactures, though it may raise the price of labour even more than an increasing demand for agricultural labour;

yet, as in this case, the quantity of food in the country may not be proportionably increasing, the advantage to the poor will be but temporary, as the price of provisions must necessarily rise in proportion to the price of labour. Relative to this subject, I cannot avoid venturing a few remarks on a part of Dr. Adam Smith's Wealth of Nations; speaking at the same time with that diffidence, which I ought certainly to feel, in differing from a person so justly celebrated in the political world.

CHAP. XVI.

Probable error of Dr. Adam Smith in representing every increase of the revenue or stock of a society as an increase in the funds for the maintenance of labour.—Instances where an increase of wealth can have no tendency to better the condition of the labouring poor.—England has increased in riches without a proportional increase in the funds for the maintenance of labour.—The state of the poor in China would not be improved by an increase of wealth from manufactures.

The professed object of Dr. Adam Smith's inquiry, is, the nature and causes of the wealth of nations. There is another inquiry, however, perhaps still more interesting, which he occasionally mixes with it; I mean an inquiry into the causes which affect the happiness of nations, or the happiness and comfort of the lower orders of society, which is the most numerous class in every nation. I am sufficiently aware of the

near connection of these two subjects, and that the causes which tend to increase the wealth of a State, tend also, generally speaking, to increase the happinels of the lower classes of the people. But perhaps Dr. Adam Smith has confidered these two inquiries as still more nearly connected than they really are; at least, he has not stopped to take notice of those instances, where the wealth of a fociety may increase (according to his definition of wealth) without having any tendency to increase the comforts of the labouring part of it. I do not mean to enter into a philosophical discussion of what constitutes the proper happiness of man; but shall merely consider two univerfally acknowledged ingredients, health, and the command of the necessaries and. conveniences of life.

Little or no doubt can exist, that the comforts of the labouring poor depend upon the increase of the funds deffined for the maintenance of labour ; and will be very exactly in proportion to the rapidity of this increase. The demand for labour which fuch increase would occasion, by creating a competition in the market, must necessarily raife the value of labour; and, till the additional number of hands required were reared, the increased funds would be diffributed to the fame number of perfons as before the increase, and therefore every labourer would live comparatively at his eafe. But perhaps Dr. Adam Smith errs in reprefenting every increase of the revenue or stock of a fociety as an increase of these funds. Such furplus stock or revenue will, indeed, always be confidered by the individual possessing it, as an additional fund

X

fund from which he may maintain more labour: but it will not be a real and effectual fund for the maintenance of an additional number of labourers, unless the whole, or at least a great part of this increase of the stock or revenue of the fociety, be convertible into a proportional quantity of provisions; and it will not be fo convertible, where the increase has arisen merely from the produce of labour, and not from the produce of land. A distinction will in this case occur, between the number of hands which the stock of the society could employ, and the number which its territory can maintain.

To explain myfelf by an inftance.

Dr. Adam Smith defines the wealth of a nation to confift in the annual produce of its land and labour. This definition evidently includes manufactured produce,

produce, as well as the produce of the land. Now supposing a nation, for a course of years, was to add what it faved from its yearly revenue, to its manufacturing capital folely, and not to its capital employed upon land, it is evident, that it might grow richer according to the above definition, without a power of supporting a greater number of last bourers, and therefore, without an increase in the real funds for the mainte nance of labour. There would, notwithstanding, be a demand for labour; from the power which each manufacturer would possess, or at least think he possessed, of extending his old stock in trade, or of fetting up fresh works. This demand would of course raife the price of labour; but if the yearly flock of provisions in the country was not increasing, this rife would foon turn out to be merely nominal, as the price of pro-

visions

visions must necessarily rife with it. The demand for manufacturing labourers might, indeed, entice many from agriculture, and thus tend to diminish the annual produce of the land; but we will suppose any effect of this kind to be compensated by improvements in the instruments of agriculture, and the quantity of provisions therefore to remain the fame. Improvements in manufacturing machinery would of course take place; and this circumstance, added to the greater number of hands employed in manufactures, would cause the annual produce of the labour of the country to be upon the whole greatly increased. The wealth therefore of the country. would be increasing annually, according to the definition, and might not, perhaps, be increasing very flowly.

The question is, whether wealth, increafing in this way, has any tendency to better the condition of the labouring poor. It is a felf-evident proposition, that any general rife in the price of labour, the stock of provisions remaining the fame, can only be a nominal rife, as it must very shortly be followed by a proportional rife in provisions. The increase in the price of labour therefore, which we have fupposed, would have little or no effect in giving the labouring poor a greater command over the necessaries and conveniences of life. In this respect they would be nearly in the fame state as before. In one other respect they would be in a worfe state. A greater proportion of them would be employed in manufactures, and fewer, confequently, in agriculture. And this exchange of professions will be allowed, I think, by

all, to be very unfavourable in respect of health, one essential ingredient of happiness, besides the greater uncertainty of manufacturing labour, arising from the capricious taste of man, the accidents of war, and other causes.

It may be faid, perhaps, that fuch an instance as I have supposed could not occur, because the rise in the price of provisions would immediately turn some additional capital into the channel of agriculture. But this is an event which may take place very slowly, as it should be remarked, that a rise in the price of labour, had preceded the rise of provisions, and would, therefore, impede the good effects upon agriculture, which the increased value of the produce of the land might otherwise have occasioned.

It might also be said, that the additional capital of the nation would enable it to import provisions sufficient for the maintenance of those whom its stock could employ. A small country with a large navy, and great inland accommodations for carriage, such as Holland, may, indeed, import and distribute an effectual quantity of provisions; but the price of provisions must be very high, to make such an importation and distribution answer in large countries, less advantageously circums stanced in this respect.

An inftance, accurately fuch as I have fupposed, may not, perhaps, ever have occurred; but I have little doubt that inftances nearly approximating to it may be found without any very laborious search. Indeed I am strongly inclined to think, that England herself, since the

revolution, affords a very striking elucidation of the argument in question.

The commerce of this country, internal, as well as external, has certainly been rapidly advancing during the last century. The exchangeable value, in the market of Europe, of the annual produce of its land and labour, has, without doubt, increased very considerably. But, upon examination, it will be found, that the increase has been chiefly in the produce of labour, and not in the produce of land; and therefore, though the wealth of the nation has been advancing with a quick pace, the effectual funds for the maintenance of labour have been increasing very flowly; and the refult is fuch as might be expected. The increasing wealth of the nation has had little or no tendency to better the condition of the lat

labouring poor. They have not, I believe, a greater command of the necessaries and conveniences of life; and a much greater proportion of them, than at the period of the revolution, is employed in manufactures, and crowded together in close and unwholesome rooms.

Could we believe the statement of Dr. Price, that the population of England has decreased fince the revolution, it would even appear, that the effectual funds for the maintenance of labour had been declining during the progress of wealth in other respects. For I conceive that it may be laid down as a general rule, that if the effectual funds for the maintenance of labour are increafing, that is, if the territory can maintain, as well as the flock employ, a greater number of labourers, this additional number will quickly fpring up,

even in spite of such wars as Dr. Price enumerates. And, consequently, if the population of any country has been stationary, or declining, we may safely infer, that, however it may have advanced in manufacturing wealth, its effectual funds for the maintenance of labour cannot have increased.

It is difficult, however, to conceive that the population of England has been declining fince the revolution; though every testimony concurs to prove that its increase, if it has increased, has been very slow. In the controversy which the question has occasioned, Dr. Price undoubtedly appears to be much more completely master of his subject, and to possess more accurate information than his opponents. Judging simply from this controversy, I think one should say, that Dr. Price's point is nearer be-

truth,

ing proved than Mr. Howlett's. Truth, probably, lies between the two statements, but this supposition makes the increase of population, since the revolution, to have been very slow, in comparison with the increase of wealth.

That the produce of the land has been decreasing, or even that it has been abfolutely stationary during the last century, few will be disposed to believe. The inclosure of commons and waste lands, certainly tends to increase the food of the country; but it has been afferted with confidence, that the inclosure of common fields, has frequently had a contrary effect; and that large tracts of land, which formerly produced great quantities of corn, by being converted into pasture, both employ fewer hands, and feed fewer mouths, than before their inclosure. It is, indeed, an acknowledged

truth, that pasture land produces a smaller quantity of human subsistence, than corn land of the same natural fertility; and could it be clearly ascertained, that from the increased demand for butchers meat of the best quality, and its increased price in consequence, a greater quantity of good land has annually been employed in grazing, the diminution of human subsistence, which this circumstance would occasion, might have counterbalanced the advantages derived from the inclosure of waste lands, and the general improvements in husbandry.

It fearcely need be remarked, that the high price of butchers meat at prefent, and its low price formerly, were not caused by the scarcity in the one case, or the plenty in the other, but by the different expence sustained at the different periods, in preparing cattle for the market.

market. It is, however, possible, that there might have been more cattle a hundred years ago in the country, than at present; but no doubt can be entertained, that there is much more meat of a fuperior quality brought to market at prefent, than ever there was. When the price of butchers meat was very low, cattle were reared chiefly upon waste lands; and except for fome of the principal markets, were probably killed with but little other fatting. The veal that is fold fo cheap in some distant counties at prefent, bears little other refemblance than the name, to that which is bought in London. Formerly, the price of butchers meat would not pay for rearing, and fearcely for feeding cattle on land that would answer in tillage; but the prefent price will not only pay for fatting cattle on the very best land, but will even allow of the rearing many, on land

land that would bear good crops of corn. The fame number of cattle, or even the fame weight of cattle at the different periods when killed, will have confumed (if I may be allowed the expression) very different quantities of human fubfistence. A fatted beast may in some respects be considered, in the language of the French economists, as an unproductive labourer: he has added nothing to the value of the raw produce that he has confumed. The present system of grazing, undoubtedly tends more than the former fystem to diminish the quantity of human subsistence in the country, in proportion to the general fertility of the land.

I would not by any means be underflood to fay, that the former fystem either could, or ought, to have continued. The increasing price of butchers meat, is a natural and inevitable confequence of the general progress of cultivation; but I cannot help thinking, that the prefent great demand for butchers meat of the best quality, and the quantity of good land that is in confequence annually employed to produce it, together with the great number of horses at present kept; for pleasure, are the chief causes, thathave prevented the quantity of human food in the country, from keeping pace with the generally increased fertility of the foil; and a change of custom in these respects, would, I have little doubt, have a very fensible effect on the quantity of fubfishence in the country, and confequently on its population.

The employment of much of the most fertile land in grazing, the improvements in agricultural instruments, the increase of large farms, and particularly

cularly, the diminution of the number of cottages throughout the kingdom, all concur to prove, that there are not probably, fo many perfons employed in agricultural labour now, as at the period of the revolution. Whatever increase of population, therefore, has taken place. must be employed almost wholly in manufactures; and it is well known. that the failure of fome of these manufactures, merely from the caprice of fashion, such as, the adoption of muslins instead of filks, or of shoe-strings, and covered buttons, instead of buckles and metal buttons, combined with the restraints in the market of labour arising from corporation, and parish laws, have frequently driven thousands on charity for support. The great increase of the poors rates, is, indeed, of itself, a strong evidence, that the poor have not a greater command of the necessaries and conveniences

niences of life; and if to the confideration, that their condition in this refpect is rather worfe than better, be added the circumstance, that a much greater proportion of them is employed in large manufactories, unfavourable both to health and virtue, it must be acknowledged, that the increase of wealth of late years, has had no tendency to increase the happiness of the labouring poor.

That every increase of the stock or revenue of a nation, cannot be considered as an increase of the real funds for the maintenance of labour, and, therefore, cannot have the same good effect upon the condition of the poor, will appear in a strong light, if the argument be applied to China.

Dr.

Dr. Adam Smith observes, that China has probably long been as rich, as the nature of her laws and institutions will admit; but that with other laws and institutions, and if foreign commerce were had in honour, she might still be much richer. The question is, would such an increase of wealth, be an increase of the real funds for the maintenance of labour, and consequently, tend to place the lower classes of people in China in a state of greater plenty?

It is evident, that if trade and foreign commerce were held in great honour in China; from the plenty of labourers, and the cheapness of labour, she might work up manufactures for foreign sale to an immense amount. It is equally evident, that from the great bulk of provisions, and the amazing extent of her inland territory, she could not in return import

import fuch a quantity; as would be any fenfible addition to the annual stock of fubfiftence in the country. Her immense amount of manufactures, therefore, the would exchange, chiefly, for luxuries collected from all parts of the world. At prefent, it appears, that no labour whatever is spared in the production of food. The country is rather over peopled in proportion to what its flock can employ, and labour is, therefore, fo abundant, that no pains are taken to abridge it. The confequence of this, is, probably, the greatest production of food that the foil can possibly afford: for it will be generally observed, that processes for abridging labour, though they may enable a farmer to bring a certain quantity of grain cheaper to market, tend rather to diminish, than increase the whole produce; and in agriculture, therefore, may, in some respects, be considered

rather

rather as private, than public advantages. An immense capital could not be employed in China in preparing manufactures for foreign trade, without taking off fo many labourers from agriculture, as to alter this state of things, and in fome degree to diminish the produce of the country. The demand for manufacturing labourers would naturally raife the price of labour; but as the quantity of fubfistence would not be increased, the price of provisions would keep pace with it; or even more than keep pace with it, if the quantity of provisions were really decreasing. The country would be evidently advancing in wealth: the exchangeable value of the annual produce of its land and labour, would be annually augmented; yet the real funds for the maintenance of labour, would be stationary, or even declining; and, confequently, the increasing wealth of

the nation would rather tend to depress, than to raise, the condition of the poor. With regard to the command over the necessaries and comforts of life, they would be in the same or rather worse state than before; and a great part of them would have exchanged the healthy labours of agriculture, for the unhealthy occupations of manufacturing industry.

The argument, perhaps, appears clearer when applied to China, because it is generally allowed, that the wealth of China has been long stationary. With regard to any other country it might be always a matter of dispute, at which of the two periods, compared, wealth was increasing the fastest; as it is upon the rapidity of the increase of wealth at any particular period, that Dr. Adam Smith says the condition of the poor depends. It is evident, however, that two nations might

Y 3

increase

increase, exactly with the same rapidity, in the exchangeable value of the annual produce of their land and labour; yet if one had applied itself chiefly to agriculture, and the other chiefly to commerce, the funds for the maintenance of labour, and consequently the effect of the increase of wealth in each nation, would be extremely different. In that which had applied itself chiefly to agriculture, the poor would live in great plenty, and population would rapidly increase. In that which had applied itself chiefly to commerce, the poor would be comparatively but little benefited, and confequently population would increase flowly.

CHAP. XVII.

Question of the proper definition of the wealth of a state.

—Reason given by the French Economists for considering all manufacturers as unproductive labourers, not the true reason.—The labour of artificers and manufacturers sufficiently productive to individuals, though not to the state.—A remarkable passage in Dr. Prices's two volumes of observations.—Error of Dr. Price in attributing the happiness and rapid population of America, chiefly, to its peculiar state of civilization.—No advantage can be expected from shutting our eyes to the difficulties in the way to the improvement of society.

A QUESTION feems naturally to arife here, whether the exchangeable value of the annual produce of the land and labour, be the proper definition of the wealth of a country; or, whether the groß produce of the land, according to the French œconomists, may not be a more accurate definition. Certain it is, that every increase of wealth, according to the definition of the Œconomists, will

be an increase of the funds for the maintenance of labour, and confequently will always tend to ameliorate the condition of the labouring poor; though an increase of wealth, according to Dr. Adam Smith's definition, will by no means invariably have the fame tendency. And yet it may not follow from this confideration, that Dr. Adam Smith's definition is not just. It feems in many respects improper, to exclude the cloathing and lodging of a whole people from any part of their revenue. Much of it may, indeed, be of very trivial and unimportant value, in comparison with the food of the country; yet still it may be fairly confidered as a part of its revenue: and, therefore, the only point in which I should differ from Dr. Adam Smith, is, where he feems to confider every increase of the revenue or stock of a fociety, as an increase of the funds

for the maintenance of labour, and confequently, as tending always to ameliorate the condition of the poor.

The fine filks and cottons, the laces, and other ornamental luxuries, of a rich country, may contribute very confiderably to augment the exchangeable value of its annual produce; yet they contribute but in a very fmall degree, to augment the mass of happiness in the fociety: and it appears to me, that it is with fome view to the real utility of the produce, that we ought to estimate the productiveness, or unproductiveness of different forts of labour. The French Œconomists consider all labour employed in manufactures as unproductive. Comparing it with the labour employed upon land, I should be perfectly disposed to agree with them; but not exactly for the reasons which they give.

They

They fay, that labour employed upon land is productive, because the produce, over and above completely paying the labourer and the farmer, affords a clear rent to the landlord; and that the labour employed upon a piece of lace is unproductive, because it merely replaces the provisions that the workman had confumed, and the flock of his employer, without affording any clear rent whatever. But supposing the value of the wrought lace to be fuch, as that befides paying in the most complete manner the workman and his employer, it could afford a clear rent to a third person; it appears to me, that in comparison with the labour employed upon land, it would be still as unproductive as ever. Though according to the reafoning used by the French Œconomists, the man employed in the manufacture of lace would, in this case, seem to be a productive

ductive labourer; yet according to their definition of the wealth of a state, he ought not to be confidered in that light. He will have added nothing to the gross produce of the land; he has confumed a portion of this gross produce, and has left a bit of lace in return; and though he may fell this bit of lace for three times the quantity of provisions that he confumed whilft he was making it, and thus be a very productive labourer with regard to himself; yet he cannot be considered as having added by his labour to any effential part of the riches of the state. The clear rent, therefore, that a certain produce can afford, after paying the expences of procuring it, does not appear to be the fole criterion, by which to judge of the productiveness or unproductiveness to a state, of any particular species of labour.

Suppose, that two hundred thousand men, who are now employed in producing manufactures, that only tend to gratify the vanity of a few rich people, were to be employed upon fome barren and uncultivated lands, and to produce only half the quantity of food that they themselves confumed; they would be still. more productive labourers with regard to the state, than they were before; though their labour, fo far from affording a rent to a third person, would but half replace the provisions used in obtaining the produce. In their former employment, they confumed a certain portion of the food of the country, and left in return, fome filks and laces. In their latter employment, they confumed the fame quantity of food, and left in return, provision for a hundred thousand men. There can be little doubt, which of the two legacies would be the most really

really beneficial to the country; and it will, I think, be allowed, that the wealth which supported the two hundred thoufand men, while they were producing silks and laces, would have been more usefully employed in supporting them, while they were producing the additional quantity of food.

A capital employed upon land, may be unproductive to the individual that employs it, and yet be highly productive to the fociety. A capital employed in trade on the contrary, may be highly productive to the individual, and yet be almost totally unproductive to the fociety: and this is the reason why I should call manufacturing labour unproductive, in comparison of that which is employed in agriculture, and not for the reason given by the French Œconomists. It is, indeed, almost impossible, to see

the great fortunes that are made in trade; and the liberality with which fo many merchants live, and yet agree in the flatement of the Œconomists, that manufacturers can only grow rich by depriving themselves of the funds deftined for their fupport. In many branches of trade the profits are fo great, as would allow of a clear rent to a third person: but as there is no third person in the cafe, and as all the profits centre in the master manufacturer, or merchant, he feems to have a fair chance of growing rich, without much privation; and we confequently fee large fortunes acquired in trade by perfons who have not been remarked for their parfimony.

Daily experience proves, that the labour employed in trade and manufactures, is fufficiently productive to individuals; but it certainly is not productive in the fame degree

degree to the state. Every accession to the food of a country, tends to the immediate benefit of the whole fociety; but the fortunes made in trade, tend, but in a remote and uncertain manner, to the fame end, and in fome respects have even a contrary tendency. The home trade of confumption, is by far the most important trade of every nation. China is the richest country in the world, without any other. Putting then, for a moment, foreign trade out of the question, the man, who by an ingenious manufacture, obtains a double portion out of the old stock of provisions, will certainly not be fo useful to the state, as the man who. by his labour, adds a fingle share to the former stock. The confumable commodities of filks, laces, trinkets, and expenfive furniture, are undoubtedly a part of the revenue of the fociety; but they are the revenue only of the rich, and

not of the fociety in general. An increase in this part of the revenue of a state, cannot, therefore, be considered of the same importance, as an increase of food, which forms the principal revenue of the great mass of the people.

Foreign commerce adds to the wealth of a state, according to Dr. Adam Smith's definition, though not according to the definition of the economists. Its principal use, and the reason, probably, that it has in general been held in fuch high estimation, is, that it adds greatly to the external power of a nation, or to its power of commanding the labour of other countries; but it will be found, upon a near examination, to contribute but little to the increase of the internal funds for the maintenance of labour, and confequently but little to the happiness of the greatest part of society. In the natural progrefs

progress of a state towards riches, manufactures, and foreign commerce: would follow, in their order, the high cultivation of the foil. In Europe, this natural order of things has been inverted; and the foil has been cultivated from the redundancy of manufacturing capital, instead of manufactures rifing from the redundancy of capital employed upon land: The fuperior encouragement that has been given to the industry of the towns, and the confequent higher price that is paid for the labour of artificers, than for the labour of those employed in husbandry, are probably the reasons why so much foil in Europe remains uncultivated. Had a different policy been purfued through out Europe, it might undoubtedly have been much more populous than at prefent, and yet not be more incumbered by its population:

I cannot quit this curious subject of the difficulty arifing from population, a fubject, that appears to me, to deferve a minute investigation, and able discussion, much beyond my power to give it, without taking notice of an extraordinary passage in Dr. Price's two volumes of Obfervations. Having given fome tables on the probabilities of life, in towns and in the country, he fays,* "From this comparison, it appears, with how much truth great cities have been called the graves of mankind. It must also convince all who will confider it, that according to the obfervation, at the end of the fourth effay, in the former volume, it is by no means strictly proper to consider our diseases as the original intention of nature. They are, without doubt, in general our own creation. Were there a country where the

^{*} Vol. 2, page 243.

inhabitants led lives entirely natural and virtuous, few of them would die without measuring out the whole period of present existence allotted to them; pain and distemper would be unknown among them, and death would come upon them like a sleep, in consequence of no other cause than gradual and unavoidable decay."

I own, that I felt myfelf obliged to draw a very opposite conclusion from the facts advanced in Dr. Price's two volumes. I had for some time been aware, that population and food, increased in different ratios; and a vague opinion had been floating in my mind, that they could only be kept equal by some species of misery or vice; but the perusal of Dr. Price's two volumes of Observations, after that opinion had been conceived, raised it at once to conviction. With so many sacts in his view, to prove the

extraordinary rapidity with which population increases, when unchecked; and with fuch a body of evidence before him, to elucidate, even the manner, by which the general laws of nature reprefs a redundant population; it is perfectly inconceivable to me, how he could write the passage that I have quoted. He was a ftrenuous advocate for early marriages, as the best prefervative against vicious manners. He had no fanciful conceptions about the extinction of the passion between the fexes, like Mr. Godwin, nor did he ever think of eluding the difficulty in the ways hinted at by Mr. Condorcet. He frequently talks of giving the prolifick powers of nature room to exert themselves. Yet with these ideas, that his understanding could escape from the obvious and necessary inference, that an unchecked population would increase, beyond comparison, faster than the earth,

by the best directed exertions of man, could produce food for its support, appears to me as astonishing, as if he had resisted the conclusion of one of the plainest propositions of Euclid.

Dr. Price, speaking of the different stages of the civilized state, fays, "The first, or simple stages of civilization, are those which favour most the increase and the happiness of mankind." He then inftances the American colonies, as being at that time in the first, and happiest of the states, that he had described; and as affording a very striking proof of the effects of the different stages of civilization on population. But he does not feem to be aware, that the happiness of the Americans, depended much less upon their peculiar degree of civilization, than upon the peculiarity of their function, as new colonies, upon there having a

Z 3

great plenty of fertile uncultivated land. In parts of Norway, Denmark, or Sweden, or in this country, two or three hundred years ago, he might have found perhaps nearly the fame degree of civilization; but by no means the fame happiness, or the same increase of population. He quotes himself a statute of Henry the Eighth, complaining of the decay of tillage, and the enhanced price of provifions, "whereby a marvellous number of people were rendered incapable of maintaining themselves and families." The fuperior degree of civil liberty which prevailed in America, contributed, without doubt, its share, to promote the industry, happiness, and population of these states: but even civil liberty, all powerful as it is, will not create fresh land. The Americans may be faid, perhaps, to enjoy a greater degree of civil liberty, now they are an independent people, than while they

they were in subjection to England; but we may be perfectly sure, that population will not long continue to increase with the same rapidity as it did then.

A person who contemplated the happy state of the lower classes of people in America twenty years ago, would naturally wish to retain them for ever in that state; and might think, perhaps, that by preventing the introduction of manufactures and luxury, he might effect his purpose: but he might as reasonably expect to prevent a wife or mistress from growing old by never exposing her to the fun or air. The fituation of new colonies, well governed, is a bloom of youth that no efforts can arrest. There are, indeed, many modes of treatment in the political, as well as animal body, that contribute to accelerate or retard the approaches of age: but there can be no chance of fuccess, in any mode that could be devised, for keeping either of them in perpetual youth. By encouraging the industry of the towns more than the industry of the country, Europe may be faid, perhaps, to have brought on a premature old age. A different policy in this respect, would infuse fresh life and vigour into every state. While from the law of primogeniture, and other European customs, land bears a monopoly price, a capital can never be employed in it with much advantage to the individual; and, therefore, it is not probable that the foil should be properly cultivated. And, though in every civilized state, a class of proprietors and a class of labourers must exist; yet one permanent advantage would always refult from a nearer equalization of property. The greater the number of proprietors, the fmaller muft

be the number of labourers: a greater part of fociety would be in the happy state of possessing property; and a fmaller part in the unhappy state of possessing no other property than their labour. But the best directed exertions, though they may alleviate, can never remove the pressure of want; and it will be difficult for any person who contemplates the genuine fituation of man on earth, and the general laws of nature, to suppose it possible that any, the most enlightened efforts, could place mankind in a state where "few would die without measuring out the whole period of prefent existence allotted to them; where pain and diftemper would be unknown among them; and death would come upon them like a fleep, in confequence of no other cause than gradual and unavoidable decay."

It is, undoubtedly, a most disheartening reflection, that the great obstacle in the way to any extraordinary improvement in fociety, is of a nature that we can never hope to overcome. The perpetual tendency in the race of man to increase beyond the means of fubfistence, is one of the general laws of animated nature, which we can have no reason to expect will change. Yet, discouraging as the contemplation of this difficulty must be, to those whose exertions are laudably directed to the improvement of the human species, it is evident, that no possible good can arise from any endeavours to flur it over, or keep it in the back ground. On the contrary, the most baleful mischiefs may be expected from the unmanly conduct of not daring to face truth, because it is unpleasing. Independently of what relates to this great obstacle, *fufficient*

fufficient yet remains to be done for mankind, to animate us to the most unremitted exertion. But if we proceed without a thorough knowledge, and accurate comprehension of the nature, extent, and magnitude, of the difficulties we have to encounter, or if we unwifely direct our efforts towards an object, in which we cannot hope for fuccess; we shall not only exhaust our strength in fruitless exertions, and main at as great a distance as ever from the fummit of our wishes; but we shall be perpetually crushed by the recoil of this rock of Sifyphus.

CHAP. XVIII.

The constant pressure of distress on man, from the principle of population, seems to direct our hopes to the suture.

—State of trial inconsistent with our ideas of the fore-knowledge of God.—The world, probably, a mighty process for awakening matter into mind.—Theory of the formation of mind.—Excitements from the wants of the body.—Excitements from the operation of general laws.

Excitements from the difficulties of life arising from the principle of population.

The view of human life, which refults from the contemplation of the conftant preffure of diffress on man from the difficulty of subfishence, by shewing the little expectation that he can reasonably entertain of perfectibility on earth, seems strongly to point his hopes to the future. And the temptations to which he must necessarily be exposed, from the operation of those laws of nature which we have been examining,

amining, would feem to represent the world, in the light in which it has been frequently considered, as a state of trial, and school of virtue, preparatory to a superior state of happiness. But I hope I shall be pardoned, if I attempt to give a view in some degree different of the situation of man on earth, which appears to me, to be more consistent with the various phenomena of nature which we observe around us, and more consonant to our ideas of the power, goodness, and foreknowledge of the Deity.

It cannot be confidered as an unimproving exercise of the human mind to endeayour to

" Vindicate the ways of God to man."

If we proceed with a proper diffrust of our own understandings, and a just fense fense of our insufficiency to comprehend the reason of all that we see; if we hail every ray of light with gratitude; and when no light appears, think that the darkness is from within, and not from without; and bow with humble deserence to the supreme wisdom of him, whose "thoughts are above our thoughts," "as the heavens are high above the earth."

In all our feeble attempts, however, to "find out the Almighty to perfection," it feems absolutely necessary, that we should reason from nature up to nature's God, and not presume to reason from God to nature. The moment we allow ourselves to ask why some things are not otherwise, instead of endeavouring to account for them, as they are, we shall never know where to stop; we shall be led into the grossest,

grossest, and most childish absurdities; all progress in the knowledge of the ways of Providence must necessarily be at an end; and the study will even cease to be an improving exercise of the human mind. Infinite power is fo vaft and incomprehenfible an idea, that the mind of man must necessarily be bewildered in the contemplation of it. With the crude and puerile conceptions which we fometimes form of this attribute of the Deity, we might imagine that God could call into being myriads, and myriads of existences; all free from pain and imperfection; all eminent in goodness and wisdom; all capable of the highest enjoyments; and unnumbered as the points throughout infinite space. But when from these vain and extravagant dreams of fancy, we turn our eyes to the book of nature, where alone we can read God as he is, we fee a constant fuccession of sentient beings, rising apparently from fo many specks of matter, going through a long and fometimes painful process in this world; but many of them attaining, ere the termination of it, fuch high qualities and powers, as feem to indicate their fitness for fome fuperior state. Ought we not then to correct our crude and puerile ideas of Infinite Power from the contemplation of what we actually fee existing? Can we judge of the Creator but from his creation? And, unless we wish to exalt the power of God at the expence of his goodness, ought we not to conclude, that even to the Great Creator, Almighty as he is, a certain process may be necessary, a certain time, (or at least what appears to us as time) may be requisite, in order to form beings with those exalted qualities of mind which will fit them for his high purpofes?

A state of trial seems to imply a previously formed existence, that does not agree with the appearance of man in infancy, and indicates fomething like fuspicion and want of foreknowledge, inconfiftent with those ideas which we wish to cherish of the Supreme Being. I should be inclined, therefore, as I have hinted before in a note, to confider 'the world, and this life, as the mighty process of God, not for the trial, but for the creation and formation of mind; a process necessary, to awaken inert, chaotic matter, into spirit; to sublimate the dust of the earth into foul; to elicit an æthereal spark from the clod of clay. And in this view of the fubject, the various impressions and excitements which man receives through life, may be confidered as the forming hand of his Creator, acting by general laws, and awakening his fluggish ex-

A a iftence,

existence, by the animating touches of the Divinity, into a capacity of superior enjoyment. The original sin of man, is the torpor and corruption of the chaotic matter, in which he may be said to be born.

It could answer no good purpose to enter into the question, whether mind be a distinct substance from matter, or only a finer form of it. The question is, perhaps, after all, a question merely of words. Mind is as effentially mind, whether formed from matter, or any other fubstance. We know, from experience, that foul and body are most intimately united; and every appearance feems to indicate, that they grow from infancy together. It would be a fupposition attended with very little probability, to believe that a complete and full formed spirit existed in every infant;

but that it was clogged and impeded in its operations, during the first twenty years of life, by the weakness, or hebetude, of the organs in which it was enclosed. As we shall all be disposed to agree, that God is the creator of mind as well as of body; and as they both feem to be forming and unfolding themselves at the fame time; it cannot repear inconfistent either with reason or revelation, if it appear to be confistent with the phenomena of nature, to suppose that God is confiantly occupied in forming mind out of matter, and that the various impressions that man receives through life, is the process for that purpofe. The employment is furely worthy of the highest attributes of the Deity.

This view of the state of man on earth will not feem to be unattended with probability, if, judging from the little experience we have of the nature of mind, it shall appear, upon investigation, that the phenomena around us, and the various events of human life, seem peculiarly calculated to promote this great end: and especially, if, upon this supposition, we can account, even to our own narrow understandings, for many of those roughnesses and inequalities in life, which querulous man too frequently makes the subject of his complaint against the God of nature.

The first great awakeners of the mind seem to be the wants of the body*.

* It was my intention to have entered at some length into this subject, as a kind of second part to the essay. A long interruption, from particular business, has obliged me to lay aside this intention, at least for the present. I shall now, therefore, only give a sketch of a few of the leading circumstances that appear to me to sayour the general supposition that I have advanced.

They are the first stimulants that rouse the brain of infant man into fentient activity: and fuch feems to be the fluggishness of original matter, that unless, by a peculiar course of excitements, other wants, equally powerful, are generated, these stimulants seem, even afterwards. to be necessary, to continue that activity which they first awakened. The favage would flumber for ever under his tree. unless he were roused from his torpor by the cravings of hunger, or the pinchings of cold; and the exertions that he makes to avoid these evils, by procuring food, and building himfelf a covering, are the exercifes which form and keep in motion his faculties, which otherwife would fink into liftless inactivity. From all that experience has taught us concerning the structure of the human mind, if those ftimulants to exertion, which arise from the wants of the body, were removed

from

from the mass of mankind, we have much more reason to think, that they would be funk to the level of brutes, from a deficiency of excitements, than that they would be raifed to the rank of philosophers by the possession of leisure. In those countries, where nature is the most redundant in spontaneous produce, the inhabitants will not be found the most remarkable for acuteness of intellect Necessity has been with great truth called the mother of invention. Some of the noblest exertions of the human mind have been fet in motion by the necessity of fatisfying the wants of the body. Want has not unfrequently given wings to the imagination of the poet; pointed the flowing periods of the historian; and added acuteness to the researches of the philosopher: and though there are undoubtedly many minds at prefent, fo far improved by the various excitements of knowledge, or of focial fympathy, that they would not relapse into listlesness, if their bodily stimulants were removed; yet, it can scarcely be doubted, that these stimulants could not be withdrawn from the mass of mankind, without producing a general and satal torpor, destructive of all the germs of suture improvement.

Locke, if I recollect, fays, that the endeavour to avoid pain, rather than the purfuit of pleafure, is the great stimulus to action in life: and that in looking to any particular pleafure, we shall not be roused into action in order to obtain it, till the contemplation of it has continued so long, as to amount to a sensation of pain or uneasiness under the absence of it. To avoid evil, and to pursue good, seems to be the great duty and business of man; and this world appears to be A a 4 peculiarly

nity of the most unremitted exertion of this kind: and it is by this exertion, by these stimulants, that mind is formed. If Locke's idea be just, and there is great reason to think that it is, evil feems to be necessary to create exertion; and exertion seems evidently necessary to create mind.

The necessity of food for the support of life, gives rife, probably, to a greater quantity of exertion, than any other want, bodily or mental. The supreme Being has ordained, that the earth shall not produce food in great quantities, till much preparatory labour and ingenuity has been exercised upon its surface. There is no conceivable connection to our comprehensions, between the seed, and the plant, or tree, that rifes from it. The Supreme Creator might, undoubtedly,

raife up plants of all kinds, for the ufe of his creatures, without the afsistance of those little bits of matter, which we call feed, or even without the assisting labour and attention of man. The processes of ploughing and clearing the ground, of collecting and sowing feeds, are not surely for the assistance of God in his creation; but are made previously necessary to the enjoyment of the blessings of life, in order to rouse man into action, and form his mind to reason.

To furnish the most unremitted excitements of this kind, and to urge man to further the gracious designs of Providence, by the full cultivation of the earth, it has been ordained, that population should increase much faster than food. This general law, (as it has appeared in the former parts of this essay) undoubtedly produces much partial evil; but a little reflection

flection may, perhaps, fatisfy us, that it produces a great overbalance of good. Strong excitements feem necessary to create exertion; and to direct this exertion; and form the reasoning faculty, it feems abfolutely necessary, that the Supreme Being should act always according to general laws. The constancy of the laws of nature, or the certainty, with which we may expect the same effect, from the fame causes, is the foundation of the faculty of reason. If in the ordinary course of things, the finger of God were frequently visible; or to speak more correctly, if God were frequently to change his purpose, - (for the finger of God is, indeed, visible in every blade of grafs that we fee) a general and fatal torpor of the human faculties would probably enfue; even the bodily wants of mankind would ceafe to stimulate them to exertion, could they not reasonably expect,

expect, that if their efforts were well directed, they would be crowned with fuccess. The constancy of the laws of nature, is the foundation of the industry and foresight of the husbandman; the indefatigable ingenuity of the artificer; the skilful researches of the physician, and anatomist; and the watchful observation, and patient investigation, of the natural philosopher. To this constancy, we owe all the greatest, and noblest efforts of intellect. To this constancy, we owe the immortal mind of a Newton.

As the reasons, therefore, for the constancy of the laws of nature, seem, even to our understandings, obvious and striking; if we return to the principle of population, and consider man as he really is, inert, sluggish, and averse from labour, unless compelled by necessity, (and it is surely the height of folly to talk of

man, according to our crude fancies, of what he might be) we may pronounce, with certainty, that the world would not have been peopled, but for the fuperiority of the power of population to the means of subfiftence. Strong, and confrantly operative as this ftimulus is on man, to urge him to the cultivation of the earth; if we still see that cultivation proceeds very flowly, we may fairly conclude, that a lefs stimulus would have been infufficient. Even under the operation of this conftant excitement, favages will inhabit countries of the greatest natural fertility, for a long period, before they betake themselves to pasturage or agriculture. Had population and food increased in the same ratio, it is probable that man might never have emerged from the favage state. But supposing the earth once well peopled, an Alexander, a Julius Cæfar, a Tamerlane, or a bloody revolution, might irrecoverably thin the

human

human race, and defeat the great defigns of the Creator. The ravages of a contagious disorder would be felt for ages; and an earthquake might unpeople a region for ever. The principle, according to which population increases, prevents the vices of mankind, or the accidents of nature, the partial evils arifing from general laws, from obstructing the high purpose of the creation. It keeps the inhabitants of the earth always fully up to the level of the means of fubfistence; and is constantly acting upon man as a powerful stimulus, urging him to the further cultivation of the earth, and to enable it, confequently, to fupport a more extended population. But it is impossible that this law can operate, and produce the effects apparently intended by the Supreme Being, without occasioning partial evil. Unless the principle of population were to be altered, according

according to the circumstances of each separate country, (which would not only be contrary to our universal experience, with regard to the laws of nature, but would contradict even our own reason, which sees the absolute necessity of general laws, for the formation of intellect;) it is evident, that the same principle, which, seconded by industry, will people a fertile region in a few years, must produce distress in countries that have been long inhabited.

It feems, however, every way probable, that even the acknowledged difficulties occasioned by the law of population, tend rather to promote, than impede the general purpose of Providence. They excite universal exertion, and contribute to that infinite variety of situations, and consequently of impressions, which seems, upon the whole, savoura-

ble to the growth of mind. It is probable, that too great, or too little excitement, extreme poverty, or too great riches, may be alike unfavourable in this respect. The middle regions of society feem to be best suited to intellectual improvement; but it is contrary to the analogy of all nature, to expect that the whole of fociety can be a middle region. The temperate zones of the earth, feem to be the most favourable to the mental, and corporeal energies of man; but all cannot be temperate zones. A world, warmed and enlightened but by one fun, must, from the laws of matter, have some parts chilled by perpetual frosts, and others fcorched by perpetual heats. Every piece of matter lying on a furface, must have an upper, and an under side: all the particles cannot be in the middle. The most valuable parts of an oak, to a timber merchant, are not either the roots, or the branches; but these are absolutely necessary to the existence of the middle part, or stem, which is the object in request. The timber merchant could not possibly expect to make an oak grow without roots or branches; but if he could find out a mode of cultivation, which would cause more of the substance to go to stem, and less to root and branch, he would be right to exert himself in bringing such a system into general use,

In the fame manner, though we cannot possibly expect to exclude riches, and poverty, from fociety; yet if we could find out a mode of government, by which, the numbers in the extreme regions would be lessened, and the numbers in the middle regions increased, it would be undoubtedly our duty to adopt it. It is not, however, improbable, that

as in the oak, the roots and branches could not be diminished very greatly, without weakening the vigorous circulation of the fap in the stem; so in society, the extreme parts could not be diminished beyond a certain degree, without leffening that animated exertion throughout the middle parts, which is the very cause, that they are the most favourable to the growth of intellect. If no man could hope to rife, or fear to fall, in fociety; if industry did not bring with it its reward, and idleness its punishment, the middle parts would not certainly be what they now are. In reasoning upon this fubject, it is evident, that we ought to consider chiefly the mass of mankind, and not individual instances. There are undoubtedly many minds, and there ought to be many, according to the chances, out of fo great a mass, that, having been vivified early, by a peculiar courfe Bb

course of excitements, would not need the constant action of narrow motives, to continue them in activity. But if we were to review the various useful discoveries, the valuable writings, and other laudable exertions of mankind; I believe we should find, that more were to be attributed to the narrow motives that operate upon the many, than to the apparently more enlarged motives that operate upon the few.

Leifure is, without doubt, highly valuable to man; but taking man, as he is, the probability feems to be, that in the greater number of inftances, it will produce evil rather than good. It has been not unfrequently remarked, that talents are more common among younger brothers, than among elder brothers; but it can fearcely be imagined, that younger brothers are, upon an average, born with a greater

a greater original susceptibility of parts. The difference, if there really is any observable difference, can only arise from their different situations. Exertion and activity, are in general absolutely necessary in the one case, and are only optional in the other.

That the difficulties of life, contribute to generate talents, every days experience must convince us. The exertions that men find it necessary to make, in order to support themselves or families, frequently awaken faculties, that might otherwise have lain for ever dormant: and it has been commonly remarked, that new and extraordinary situations gonerally create minds adequate to grapple with the difficulties in which they are involved.

CHAP. XIX.

The forrows of life necessary to soften and humanize the heart.—The excitements of social sympathy often produce characters of a higher order than the mere possessor of talents.—Moral evil probably necessary to the production of moral excellence.—Excitements from intellectual wants continually kept up by the infinite variety of nature, and the obscurity that involves metaphysical subjects.—The difficulties in Revelation to be accounted for upon this principle.—The degree of evidence which the scriptures contain, probably, best suited to the improvement of the human faculties, and the moral amelioration of mankind.—The idea that mind is created by excitements, seems to account for the existence of natural and moral evil.

THE forrows and distresses of life form another class of excitements, which seem to be necessary, by a peculiar train of impressions, to soften and humanize the heart, to awaken social sympathy, to generate all the Christian virtues, and to afford scope for the ample exertion of benevolence. The general tendency

of an uniform course of prosperity is, rather to degrade, than exalt the character. The heart that has never known forrow itself, will feldom be feelingly alive, to the pains and pleafures, the wants and wishes, of its fellow beings. It will feldom be overflowing with that warmth of brotherly love, those kind and amiable affections, which dignify the human character, even more than the possession of the highest talents. Talents, indeed, though undoubtedly a very prominent and fine feature of mind, can by no means be confidered as conftituting the whole of it. There are many minds which have not been exposed to those excitements, that usually form talents, that have yet been vivified to a high degree, by the excitements of focial fympathy. In every rank of life, in the lowest, as frequently as in the highest, characters are to be found, overflowing with the

B b 3

milk

milk of human kindness, breathing love towards God and man; and though without those peculiar powers of mind called talents, evidently holding a higher rank in the fcale of beings, than many who possess them. Evangelical charity, meekness, piety, and all that class of virtues, distinguished particularly by the name of Christian virtues, do not seem necessarily to include abilities; yet a foul poffessed of these amiable qualities, a soul awakened and vivified by thefe delightful fympathies, feems to hold a nearer commerce with the skies, than mere acuteness of intellect.

The greatest talents have been frequently misapplied, and have produced evil proportionate to the extent of their powers. Both reason and revelation seem to assure us, that such minds will be condemned to eternal death; but while on earth.

earth, these vicious instruments performed their part in the great mass of impresfions, by the difgust and abhorrence which they excited. It feems highly probable, that moral evil is absolutely necessary to the production of moral excellence. A being with only good placed in view, may be justly faid to be impelled by a blind necessity. The pursuit of good in this case, can be no indication of virtuous propenfities. It might be faid, perhaps, that Infinite Wifdom, cannot want fuch an indication as outward action, but would foreknow, with certainty, whether the being would chuse good or evil. This might be a plaufible argument against a state of trial; but will not hold against the supposition, that mind in this world is in a flate of formation. Upon this idea, the being that has feen moral evil, and has felt disapprobation and difgust at it, is essentially

B b 4 different

different from the being that has feen only good. They are pieces of clay that have received distinct impressions: they must, therefore, necessarily be in different shapes; or, even if we allow them both to have the same lovely form of virtue, it must be acknowledged, that one has undergone the further process, necessary to give firmness and durability to its fubstance; while the other is still exposed to injury, and liable to be broken by every accidental impulse. An ardent love and admiration of virtue feems to imply the existence of something oppofite to it; and it feems highly probable, that the fame beauty of form and fubstance, the same perfection of character, could not be generated, without the impressions of disapprobation which arise from the spectacle of moral evil.

When the mind has been awakened into activity by the passions, and the wants of the body, intellectual wants arise; and the desire of knowledge, and the impatience under ignorance, form a new and important class of excitements. Every part of nature seems peculiarly calculated to furnish stimulants to mental exertion of this kind, and to offer inexhaustible food for the most unremitted inquiry. Our immortal Bard says of Cleopatra—

The expression, when applied to any one object, may be considered as a poetical amplification, but it is accurately true when applied to nature. Infinite variety, seems, indeed, eminently her characteristic feature. The shades that are here and there blended in the picture, give spirit,

[&]quot; Custom cannot stale "Her infinite variety."

fpirit, life, and prominence to her exuberant beauties; and those roughnesses and inequalities, those inferior parts that support the superior, though they sometimes offend the fastidious miscroscopic eye of short sighted man, contribute to the symmetry, grace, and sair proportion of the whole.

The infinite variety of the forms and operations of nature, besides tending immediately to awaken and improve the mind by the variety of impressions that it creates, opens other fertile sources of improvement, by offering so wide and extensive a field for investigation and research. Uniform, undiversified perfection, could not possess the same awakening powers. When we endeavour then to contemplate the system of the universe; when we think of the stars as the suns of other systems, scattered throughout infinite space; when we reslect, that we

do not probably fee a millionth part of those bright orbs, that are beaming light and life to unnumbered worlds; when our minds, unable to grafp the immeafurable conception, fink, loft and confounded, in admiration at the mighty incomprehenfible power of the Creator: let us not querulously complain that all climates are not equally genial; that perpetual fpring does not reign throughout the year; that all God's creatures do not possess the fame advantages; that clouds and tempefts fometimes darken the natural world. and vice and mifery, the moral world; and that all the works of the creation are. not formed with equal perfection. Both reason and experience seem to indicate to us, that the infinite variety of nature. (and variety cannot exist without inferior parts, or apparent blemishes) is admirably adapted to further the high purpose of the creation, and to produce the greatest possible quantity of good.

The obscurity that involves all metaphysical subjects, appears to me, in the fame manner peculiarly calculated, to add to that class of excitements which arife from the thirst of knowledge. It is probable that man, while on earth, will never be able to attain complete fatisfaction on these subjects; but this is by no means a reason that he should not engage in them. The darkness that furrounds these interesting topics of human curiofity, may be intended to furnish endless motives to intellectual activity and exertion. The constant effort to dispel this darkness, even if it fail of fuccefs, invigorates and improves the thinking faculty. If the subjects of human inquiry were once exhaufted, mind would probably stagnate; but the infinitely diverlified forms and operations of nature, together with the endless food for speculation which metaphysical subjects offer, prevent the possibility that such a period should ever arrive.

It is by no means one of the wifest fayings of Solomon, that "there is no new thing under the fun." On the contrary, it is probable, that were the prefent fystem to continue for millions of years, continual additions would be making to the mass of human knowledge; and yet, perhaps, it may be a matter of doubt, whether, what may be called the capacity of mind, be in any marked and decided manner increasing. A Socrates, a Plato, or an Aristotle, however confeffedly inferior in knowledge to the philosophers of the present day, do not appear to have been much below them in intellectual capacity. Intellect rifes from a speck, continues in vigour only for a certain period, and will not, perhaps, admit, while on earth, of above

a certain number of impressions. These impressions may, indeed, be infinitely modified, and from these various modifications, added probably to a difference in the susceptibility of the original germs*, arise the endless diversity of character that we see in the world; but reason and experience seem both to assure us, that the capacity of individual minds does not increase in proportion to the mass of existing knowledge. The finest minds seem to be formed rather by efforts at original

* It is probable that no two grains of wheat are exactly alike. Soil undoubtedly makes the principal difference in the blades that spring up; but probably not all. It seems natural to suppose some fort of difference in the original germs that are asterwards awakened into thought; and the extraordinary difference of susceptibility in very young children seems to confirm the supposition.

thinking,

thinking, by endeavours to form new combinations, and to discover new truths, than by passively receiving the impresfions of other men's ideas. Could we funpose the period arrived, when there was no further hope of future discoveries; and the only employment of mind was to acquire pre-existing knowledge, without any efforts to form new and original combinations; though the mass of human knowledge were a thousand times greater than it is at present; yet it is evident that one of the noblest stimulants to mental exertion would have ceased; the finest feature of intellect would be loft; every thing allied to genius would be at an end; and it appears to be impossible, that, under such circumstances, any individuals could posfefs the fame intellectual energies, as were possessed by a Locke, a Newton,

or a Shakespear, or even by a Socrates, a Plato, an Aristotle, or a Homer.

If a revelation from heaven, of which no person could feel the smallest doubt. were to dispel the mists that now hang over metaphyfical fubjects; were to explain the nature and structure of mind. the affections and effences of all fubstances, the mode in which the Supreme Being operates in the works of the creation, and the whole plan and scheme of the Universe; such an accession of knowledge, so obtained, inflead of giving additional vigour and activity to the human mind, would, in all probability, tend to reprefs future exertion, and to damp the foaring wings of intellect.

For this reason I have never confidered the doubts and difficulties that involve

involve fome parts of the facred writings, as any argument against their divine original. The Supreme Being might, undoubtedly, have accompanied his revelations to man by fuch a fuccession of miracles, and of fuch a nature, as would have produced univerfal overpowering conviction, and have put an end at once to all hefitation and difcufsion. But weak as our reason is to comprehend the plans of the Great Creator, it is yet fufficiently strong, to fee the most striking objections to fuch a revelation. From the little we know of the structure of the human understanding, we must be convinced, that an overpowering conviction of this kind, instead of tending to the improvement and moral amelioration of man, would act like the touch of a torpedo on all intellectual exertion, and

Cc

would

would almost put at end to the existence of virtue. If the scriptural denunciations of eternal punishment were brought home with the fame certainty to every man's mind, as that the night will follow the day, this one vast and gloomy idea would take fuch full poffession of the human faculties, as to leave no room for any other conceptions: the external actions of men would be all nearly alike: virtuous conduct would be no indication of virtuous difposition: vice and virtue would be blended together in one common mass; and, though the all-feeing eye of God might distinguish them, they must neceffarily make the fame impressions on man, who can judge only from external appearances. Under fuch a difpenfation, it is difficult to conceive how human beings could be formed to a de-

panied

a detestation of moral evil, and a love and admiration of God, and of moral excellence.

Our ideas of virtue and vice are not, perhaps, very accurate and well-defined; but few, I think, would call an action really virtuous, which was performed fimply and folely from the dread of a very great punishment, or the expectation of a very great reward. The fear of the Lord is very justly faid to be the beginning of wisdom; but the end of wisdom is the love of the Lord, and the admiration of moral good. The denunciations of future punishment, contained in the scripures, seem to be well calculated to arrest the progress of the vicious, and awaken the attention of the careless; but we see, from repeated experience, that they are not accom-Cc2

panied with evidence of fuch a nature, as to overpower the human will, and to make men lead virtuous lives with vicious dispositions, merely from a dread of hereafter. A genuine faith, by which I mean, a faith that shews itself in all the virtues of a truly christian life, may generally be considered as an indication of an amiable and virtuous disposition, operated upon more by love than by pure unmixed fear.

When we reflect on the temptations to which man must necessarily be exposed in this world, from the structure of his frame, and the operation of the laws of nature; and the consequent moral certainty, that many vessels will come out of this mighty creative surnace in wrong shapes; it is perfectly impossible to conceive, that any of these creatures

creatures of God's hand can be condemned to eternal fuffering. Could we once admit fuch an idea, all our natural conceptions of goodness and justice would be completely overthrown; and we could no longer look up to God as a merciful and righteous Being. But the doctrine of life and immortality which was brought to light by the gospel, the doctrine that the end of righteousness is everlasting life, but that the wages of fin are death, is in every refpect just and merciful, and worthy of the Great Creator. Nothing can appear more confonant to our reason, than that those beings which come out of the creative process of the world in lovely and beautiful forms, should be crowned with immortality; while those which come out mishapen, those whose minds are not fuited to a purer and C c 3 hap-

happier state of existence, should perish, and be condemned to mix again with their original clay. Eternal condemnation of this kind may be confidered as a species of eternal punishment; and it is not wonderful that it should be represented, sometimes, under images of fuffering. But life and death, falvation and destruction, are more frequently opposed to each other in the New Teftament, than happiness and misery. The Supreme Being would appear to us in a very different view, if we were to confider him as purfuing the creatures that had offended him with eternal hate and torture, instead of merely condemning to their original infensibility those beings, that, by the operation of general laws, had not been formed with qualities fuited to a purer state of happiness.

Life is, generally speaking, a blessing independent of a future state. It is a gift which the vicious would not always be ready to throw away, even if they had no fear of death. The partial pain, therefore, that is inflicted by the Supreme Creator, while he is-forming numberless beings to a capacity of the highest enjoyments, is but as the dust of the balance in comparison of the happiness that is communicated; and we have every reason to think, that there is no more evil in the world, than what is absolutely necessary as one of the ingredients in the mighty process.

The striking necessity of general laws for the formation of intellect, will not in any respect be contradicted by one or two exceptions; and these evidently not intended for partial purposes, but

calculated to operate upon a great part of mankind, and through many ages. Upon the idea that I have given of the formation of mind, the infringement of the general laws of nature, by a divine revelation, will appear in the light of the immediate hand of God mixing new ingredients in the mighty mass, suited to the particular state of the process, and calculated to give rife to a new and powerful train of impressions, tending to purify, exalt, and improve the human mind. The miracles that accompanied thefe revelations when they had once excited the attention of mankind, and rendered it a matter of most interesting discussion, whether the doctrine was from God or man, had performed their part, had anfwered the purpose of the Creator; and these communications of the divine will were afterwards left to make their way by their own intrinsic excellence; and by operating as moral motives, gradually to influence and improve, and not to overpower and stagnate the faculties of man.

It would be, undoubtedly, prefumptuous to fay, that the Supreme Being could not possibly have effected his purpose in any other way than that which he has chosen; but as the revelation of the divine will, which we possess, is attended with some doubts and difficulties; and as our reason points out to us the strongest objections to a revelation, which would force immediate, implicit, universal belief; we have furely just cause to think that these doubts and difficulties are no argument against the divine origin of the fcriptures; and that the species of evidence which they possess is best fuited

to the improvement of the human faculties, and the moral amelioration of mankind.

The idea that the impressions and excitements of this world are the instruments with which the Supreme Being forms matter into mind; and that the necessity of constant exertion to avoid evil, and to purfue good, is the principal fpring of these impressions and excitements, feems to fmooth many of the difficulties that occur in a contemplation of human life; and appears to me, to give a fatisfactory reason for the existence of natural and moral evil: and, confequently, for that part of both, and it certainly is not a very small part, which arises from the principle of population. But, though upon this fupposition, it feems highly improbable, that evil should ever be removed from the world; yet it is evident, that this impression would not answer the apparent purpose of the Creator; it would not act so powerfully as an excitement to exertion, if the quantity of it did not diminish or increase, with the activity or the indolence of man. The continual variations in the weight, and in the distribution of this pressure, keep alive a constant expectation of throwing it off.

pest.

Evil exists in the world, not to create despair, but activity. We are not patiently to submit to it, but to exert ourselves to avoid it. It is not only the interest, but the duty of every individual, to use his utmost efforts to remove evil from himself, and from as large a circle as he can influence;

[&]quot;Hope springs eternal in the human breast,

[&]quot; Man never is, but always to be bleft."

396

and the more he exercises himself in this duty, the more wifely he directs his efforts, and the more successful these efforts are; the more he will probably improve and exalt his own mind, and the more completely does he appear to fulfil the will of his Creator.
